

# CONTENTS

## 1 The Genetic Code

|   |    |
|---|----|
| Equivalence of Gene and Protein                   | 3  |
| definition of the gene                            | 3  |
| nucleic acids as the genetic material             | 5  |
| colinearity of gene and protein                   | 10 |
| Nature of the Code for Amino Acids                | 13 |
| overlapping and non-overlapping codes             | 13 |
| fixed reading frame of the code                   | 16 |
| assignment of codons to amino acids               | 19 |
| Nonsense Codons for Termination                   | 26 |
| suppression of nonsense and missense mutations    | 26 |
| nucleotide sequences of nonsense codons           | 28 |
| Evolution of the Code                             | 30 |
| universal nature of the code                      | 30 |
| stereochemical interactions in the primitive code | 33 |
| forces of selection on the code                   | 34 |

## 2 Synthesis of the Polypeptide Chain

|   |    |
|---|----|
| Components of the Apparatus for Protein Synthesis     | 38 |
| sequential synthesis of proteins                      | 38 |
| messenger RNA as the template                         | 40 |
| activating amino acids with transfer RNA              | 43 |
| the polyribosome complex                              | 46 |
| Addition of Amino Acids to the Polypeptide Chain      | 49 |
| ribosomal sites for transfer RNA                      | 49 |
| formation of the transfer complex with aminoacyl-tRNA | 53 |
| binding aminoacyl-tRNA to the ribosome                | 62 |
| peptide bond synthesis                                | 65 |

|   |     |
|---|-----|
| Movement of the Ribosome along the Message                  | 67  |
| role of the G factor translocase                            | 67  |
| the GTP hydrolysis site of the ribosome                     | 70  |
| <b>3 Punctuation in the Message</b>                         |     |
| Signals for Initiation                                      | 79  |
| incorporation of formyl-methionine into proteins            | 79  |
| recognition of AUG by fmet-tRNA <sub>f</sub>                | 80  |
| initiation sequences of RNA phages                          | 86  |
| Formation of the Initiation Complex                         | 89  |
| role of ribosome sites in initiation                        | 89  |
| binding of fmet-tRNA <sub>f</sub> to the initiation complex | 95  |
| ribosome binding to the messenger                           | 101 |
| distribution of ribosomes in bacterial cells                | 104 |
| the ribosome subunit cycle                                  | 108 |
| Termination of the Polypeptide Chain                        | 111 |
| factors for release of polypeptide from tRNA                | 111 |
| release reaction on the ribosome                            | 114 |
| utilization of nonsense codons                              | 114 |
| <b>4 The Ribosome</b>                                       |     |
| Components of the Ribosome Particle                         | 117 |
| folded structure of the nucleoprotein chain                 | 117 |
| major RNAs of bacterial ribosomes                           | 119 |
| sequence and synthesis of 5S ribosomal RNA                  | 120 |
| Synthesis and Assembly of Ribosome Subunits                 | 122 |
| maturation of eucaryotic ribosomal RNA                      | 122 |
| organization of bacterial genes for ribosomal RNA           | 125 |
| synthesis of ribosomal RNA precursors                       | 127 |
| isolation of precursor particles                            | 128 |
| mutants in ribosome assembly                                | 131 |
| Topology of Ribosome Subunits                               | 135 |
| proteins of <i>E.coli</i> ribosomes                         | 135 |
| organization of genes for ribosomal proteins                | 137 |
| dissociation and assembly of 30S subunits in vitro          | 139 |
| reconstitution of 50S subunits in vitro                     | 142 |
| addition of proteins to precursor particles                 | 143 |
| organization of proteins in the 30S subunit                 | 147 |
| association of proteins with 16S rRNA                       | 150 |
| organization of the 50S subunit                             | 153 |

|   |     |
|---|-----|
| Functional Sites in Ribosome Subunits     | 153 |
| subribosomal particles of the 50S subunit | 153 |
| subribosomal particles of the 30S subunit | 157 |
| influence of streptomycin on the ribosome | 159 |
| ribosomal mistranslation                  | 162 |
| mutation of the accuracy of the ribosome  | 164 |

## 5 Transfer RNA

|  |     |
|--|-----|
| Structure of tRNA  | 169 |
| sequence determination of RNA                              | 169 |
| clover leaf model for secondary structure                  | 170 |
| synthesis and maturation of the precursor                  | 176 |
| alternate tertiary conformations of tRNA                   | 179 |
| models for tertiary folding of the clover leaf             | 182 |
| Functions of the Transfer Molecule                         | 187 |
| modification of function in vitro                          | 187 |
| mutants of $su_3$ tyrosine tRNA                            | 191 |
| interaction of tRNA with synthetase                        | 194 |
| the synthetase charging reaction                           | 198 |
| Accuracy of Translation                                    | 202 |
| codon-anticodon recognition                                | 202 |
| suppression of amber and ochre mutations                   | 211 |
| suppressor mutations in the anticodon                      | 215 |
| suppression of UGA codons                                  | 219 |
| recognition of natural termination signals by mutant tRNAs | 220 |
| missense suppression by mutant tRNAs                       | 221 |
| suppression of frameshift mutations                        | 223 |

## CONTROL OF TRANSCRIPTION

### 6 Transcription of Phage Genomes

|  |     |
|--|-----|
| Synthesis of RNA by RNA Polymerase                             | 229 |
| transcription of duplex DNA templates                          | 229 |
| separation of RNA polymerase into core enzyme and sigma factor | 235 |
| release of sigma factor by core enzyme at initiation           | 237 |
| Binding Reaction and Initiation                                | 241 |
| restriction of strand transcription by sigma                   | 241 |
| binding of RNA polymerase to DNA                               | 244 |
| initiation of RNA synthesis                                    | 249 |

|   |     |
|---|-----|
| Signals for Termination of Transcription                          | 251 |
| termination sites recognised by rho factor                        | 252 |
| termination in different ionic environments                       | 255 |
| interaction of rho factor with RNA polymerase                     | 260 |
| Changes in RNA polymerase during Phage Development                | 262 |
| switches in early transcription of phage T4                       | 262 |
| changes in template and RNA polymerase during late T4 development | 266 |
| transcription of delayed early genes of phage $\lambda$           | 268 |
| <b>7 The Lactose Operon</b>                                       |     |
| Organization of Gene Clusters                                     | 272 |
| induction and repression  | 272 |
| coordinate activity of clustered genes                            | 273 |
| structural and regulator genes                                    | 275 |
| transcription of the structural genes                             | 280 |
| Interaction of Repressor and Operator                             | 285 |
| promotor for the structural genes                                 | 285 |
| sequence of the operator  | 288 |
| isolation of repressor protein                                    | 290 |
| binding of repressor to operator DNA                              | 291 |
| repression of transcription                                       | 297 |
| synthesis and structure of the repressor                          | 299 |
| Induction of Transcription at the Promotor                        | 302 |
| glucose repression by cyclic AMP                                  | 302 |
| cyclic AMP control protein  | 304 |
| isolation of the lactose genes                                    | 307 |
| <b>8 Operon Control Circuits</b>                                  |     |
| Bacterial Operons   | 310 |
| positive and negative control systems                             | 310 |
| the histidine operon  | 316 |
| positive-negative control of the arabinose operon                 | 323 |
| dual control of the galactose operon                              | 328 |
| control of dispersed genes in the arginine system                 | 333 |
| complex gene clusters   | 338 |
| evolution of control systems                                      | 343 |
| Development of Phage $\lambda$                                    | 344 |
| repression of phage DNA expression                                | 344 |
| isolation and function of repressor protein                       | 347 |
| structure of the operator/promotor sites                          | 350 |
| control of synthesis of cI repressor                              | 357 |
| sequence of lytic development                                     | 364 |

|   |     |
|---|-----|
| Control of Stable RNA Synthesis                             | 367 |
| synthesis of ribosomal RNA                                  | 367 |
| stringent/relaxed control of transcription                  | 369 |
| accumulation of guanosine tetraphosphate in stringent cells | 372 |

## 9 Expression of the Operon

|  |     |
|--|-----|
| Kinetics of Synthesis of the Tryptophan Enzymes      | 378 |
| transcription and translation of mRNA                | 378 |
| degradation of messenger RNA                         | 384 |
| internal initiation of transcription and translation | 387 |
| Polarity of Translation                              | 390 |
| influence of nonsense mutations on operon function   | 390 |
| role of reinitiation sites in polarity               | 393 |
| ribosome movement on polycistronic messengers        | 396 |
| Coupling of Transcription and Translation            | 400 |
| transcription past nonsense mutations                | 400 |
| suppression of polarity                              | 404 |
| rho-dependent termination in bacterial operons       | 406 |

## REPRODUCTION OF DNA

### 10 Replication of the Bacterial Genome

|   |     |
|---|-----|
| Movement of the Growing Points                  | 411 |
| components of the replication apparatus         | 411 |
| semi-conservative separation of DNA strands     | 412 |
| sequential movement of the replicating fork     | 414 |
| bidirectional replication from a fixed origin   | 416 |
| DNA Replication in the Bacterial Cell           | 425 |
| association of DNA with the cell membrane       | 425 |
| unwinding the double helix                      | 429 |
| accuracy of replication of DNA                  | 436 |
| discontinuous synthesis of DNA                  | 440 |
| covalent linkage of Okazaki fragments           | 446 |
| initiation of DNA synthesis with RNA primers    | 450 |
| rate of replication of the bacterial chromosome | 458 |
| Enzyme Systems for DNA Synthesis                | 459 |
| Kornberg DNA polymerase I                       | 459 |
| membrane systems for DNA synthesis              | 460 |
| DNA synthesis by DNA polymerase II              | 462 |
| temperature sensitive mutants in replication    | 464 |
| replication by DNA polymerase III               | 466 |

## 11 Modification and Repair of DNA

|  |     |
|--|-----|
| Host Modification and Restriction                                    | 471 |
| enzymes of DNA metabolism  | 471 |
| methylation of the bacterial chromosome                              | 472 |
| genes for host modification and restriction in <i>E.coli</i> K and B | 475 |
| chromosomal and episomal systems of <i>E.coli</i> 15                 | 480 |
| two host specificity systems of <i>Hemophilus influenzae</i>         | 482 |
| restriction and modification enzymes of <i>E.coli</i>                | 483 |
| mutation in recognition sites of phage DNA                           | 487 |
| symmetrical sequences of recognition sites                           | 490 |
| Excision and Repair of Mutant DNA Sequences                          | 495 |
| influence of ultraviolet irradiation                                 | 495 |
| correction systems of <i>E.coli</i>                                  | 496 |
| photoreactivation of thymine dimers                                  | 498 |
| excision and repair of damaged DNA in <i>E.coli</i>                  | 498 |
| enzymes for excision-repair in <i>M. luteus</i>                      | 501 |
| phage coded excision enzymes   | 504 |
| excision-repair in eucaryotic cells                                  | 504 |
| Recombination-Repair Systems of <i>E.coli</i>                        | 506 |
| post replication repair of DNA containing thymine dimers             | 506 |
| enzymes of the <i>rec</i> system for recombination and repair        | 511 |
| induction of mutations by ultraviolet light                          | 514 |
| catalytic activities of DNA polymerase I                             | 516 |
| role of the <i>pola</i> locus in repair                              | 520 |

## 12 Recombination Between DNA Duplexes

|   |     |
|---|-----|
| Reciprocal Exchange of Genetic Information by Crossing Over | 524 |
| physical exchange of genetic material                       | 524 |
| formation of hybrid DNA                                     | 527 |
| Recombination without Crossing Over                         | 530 |
| gene conversion in fungi                                    | 530 |
| recombination between alleles                               | 534 |
| gradients of gene conversion                                | 536 |
| Recombination Intermediates of Phage DNA                    | 542 |
| heterozygosis in phage T4                                   | 542 |
| recombination activities in T4 infected cells               | 544 |
| redundant joint molecules of phage $\lambda$                | 547 |
| correlation between recombination and repair activities     | 548 |

**13 The Cell Division Cycle**

|  |            |
|--|------------|
| Initiation of New Cycles of Replication . . . . .            | 550        |
| control of the replicon . . . . .                            | 550        |
| synthesis of initiator proteins . . . . .                    | 551        |
| initiation mutants in membrane proteins . . . . .            | 555        |
| Links between Replication Cycles and Cell Division . . . . . | 556        |
| DNA synthesis during the cell cycle . . . . .                | 556        |
| titration of cell mass . . . . .                             | 563        |
| growth of the unit cell . . . . .                            | 568        |
| trigger for cell division . . . . .                          | 571        |
| <b>References . . . . .</b>                                  | <b>577</b> |
