PREFACE TO FIRST EDITION	xiii
PREFACE TO FOURTH EDITION	xv
PART 1	
BASIC FUNGAL BIOLOGY	1
1 AN OUTLINE OF THE BIOLOGY OF FUNGI OF GENETIC INTEREST	3
General features of fungi	3
Vegetative organization—free cells versus mycelium	3
Basic features of sexual reproduction	4
Heterokaryosis	5
Nutrition	6
Some important groups and species	6
Phycomycetes	6
Ascomycetes	12
Basidiomycetes	24
Fungi Imperfecti	32
2 THE FUNGAL NUCLEUS	34
Components of the non-dividing nucleus	34
Replication of chromosomal DNA	37
Quantity of DNA per haploid genome	37
Spindle fibres and spindle plaques	37
Nucleolus in nuclear division	39
Chromosomes in meiosis	39
Chromosomes in mitosis	45
PART 2	
GENETIC ANALYSIS	49
3 INDUCTION, ISOLATION AND CHARACTERIZATION OF MUTANTS	51
Visible and biochemical mutants	52
Methods for isolating and characterizing auxotrophic mutants	55
Total isolation procedures	55
'Rescue' methods	59
Filtration enrichment	62
Starvation selection and unbalanced growth	63
Selective elimination of prototrophs by antibiotics and other drugs	65
Radioactive suicide	66
Mutations from auxotrophy to prototrophy	66
Mutations to drug resistance	68
Systems for two-way mutant selection	69
Recessive lethal mutations	70
Replicating instabilities	71

4	THE CLASSIFICATION OF MUTANTS AND THE DEFINITION OF GENES	73
	Complementation tests	74
	Heterokaryosis	74
	Diploidy	76
	Pseudowild types as a proof of complementation	77
	Cis-trans test	78
	Diploids compared with heterokaryons	79
	Partial complementation and complementation mapping	80
	Linear and non-linear complementation maps	80
	Frequency of complementing mutants	82
	Significance of complementation between alleles	83
	Identification of genes by complementation mapping of deletions	84
5	CHROMOSOME MAPPING BY MEIOTIC ANALYSIS—TETRAD ANALYSIS	88
	Unordered and ordered tetrads	89
	Segregation and tetrad types	89
	Ordered tetrads—centromeres and their random orientation	90
	Free reassortment linkage and crossing-over	92
	Criteria for linkage versus independent assortment	94
	Evidence for linkage in random spores and tetrads	94
	Map distance and gene order	96
	Calculation of map distance	96
	Principle of minimal cross-overs	97
	Mapping with random spores—selective scoring of recombinants	98
	Unordered tetrads	99
	Double crossing-over and its consequences	100
	Strand relationships between adjacent crossovers	100
	Interference between crossovers	105
	True map distance and mapping functions	107
	Correcting map distance for double crossovers	108
	Linkage maps in various fungal species	111
6	GENETIC ANALYSIS BASED ON MITOSIS	122
	Selection of diploid strains in habitually haploid fungi	122
	Analysis of haploid and diploid segregants from diploid <i>Aspergillus</i>	124
	Mitotic crossing-over and haploidization as causes of vegetative segregation	125
	Mitotic analysis in other fungi	130
	Demonstrations that mitotic crossing-over is a reciprocal event	131
	Random chromosome loss—the cause of haploidization	134
	Comparison of mitotic with meiotic mapping	135
	Parasexual cycle as an alternative to sex in nature	137
7	CHANGES IN CHROMOSOME NUMBER AND STRUCTURE	138
	Polyploidy	138
	Meiosis in autotetraploids	139
	Genetics of autotetraploids	140
	Triploids	142
	Aneuploidy	143
	Aneuploidy in <i>Aspergillus nidulans</i>	143
	Aneuploidy in <i>Saccharomyces</i>	144

	Pseudowild types in <i>Neurospora crassa</i>	146
	Structural chromosome changes	149
	Methods for detection of structural rearrangements	150
	Inversions	150
	Reciprocal translocations	152
	Non-reciprocal translocations	155
	Selective loss of duplicated chromosome segments	158
<b>8</b>	<b>EXTRACHROMOSOMAL INHERITANCE</b>	<b>162</b>
	Criteria for extranuclear inheritance	163
	Reciprocal differences in crosses and non-mendelian segregation	163
	Heterokaryon test, vegetative segregation and invasiveness	165
	Nucleus cytoplasm interactions	169
	Barrage in <i>Podospora anserina</i>	170
	Interspecific interactions in <i>Neurospora</i>	171
	<i>psi</i> element in yeast	172
	<i>URE3</i> determinant in yeast	173
	Induction of extranuclear variation	174
	Role of extrachromosomal elements in natural variation	175
	Continuous cytoplasmic variation	175
	Naturally occurring extranuclear variation at the molecular level	177
<b>9</b>	<b>INCOMPATIBILITY AND BREEDING SYSTEMS</b>	<b>178</b>
	Avoidance of self-fertilization	179
	Sexual dimorphism	179
	Heterothallism: one locus two allele systems	179
	Promotion of outbreeding	180
	Multiple-allelomorph heterothallism	180
	Compound nature of the A and B factors in tetrapolar species	182
	Relative efficiencies of different systems as outbreeding mechanisms	185
	Secondary homothallism	186
	Incompatibility following karogamy spore killers	189
	Vegetative incompatibility	190
	Non-allelic and allelic incompatibility in <i>Podospora</i>	190
	Allelic incompatibility in <i>Neurospora</i> heterokaryons	193
	Heterokaryon incompatibility in <i>Aspergillus</i>	194
	What is the value of heterokaryon incompatibility?	195
<b>10</b>	<b>RECOMBINATION WITHIN GENES AND FINE STRUCTURE MAPPING</b>	<b>197</b>
	Mapping by recombination frequencies	198
	Mapping by overlapping small deletions	200
	Simple theory of flanking markers and its limitations	202
	Gene conversion shown by tetrad analysis	205
	Frequencies of conversion	205
	Single site versus multisite conversion	206
	Relation between conversion and crossing-over—flanking markers reconsidered	207
	Polarity in gene conversion	211
	Polaron in <i>Ascobolus</i>	211
	Polarized conversion in <i>Neurospora crassa</i>	212
	Assessment of different methods	215

## PART 3

## GENE STRUCTURE AND GENE ACTION

217

## 11 MECHANISM OF RECOMBINATION

219

- Conversion and crossing-over: aspects of a common mechanism 219
- Post-meiotic segregation and the origin of hybrid DNA 220
  - Post-meiotic segregation 220
  - Possible origin of heteroduplex DNA 221
  - Asymmetric or symmetric hybrid DNA formation 225
- Correction of mis-matches in heteroduplex DNA 228
  - Evidence that correction occurs 228
  - Nature of the correction mechanism 229
  - Extent of the conversion tract 233
  - Induction of mitotic gene conversion 234
- Polarity in gene conversion 235
- Origin of crossovers 237
  - Meselson and Radding model 238
  - Crossover interference 241
- Genetic control of recombination 242
  - Recombination and repair of ultraviolet damage 243
  - Locally specific variation in recombination frequency in wild type strains 248
- Conclusions 253

## 12 MECHANISMS OF MUTATION

254

- Classifications of mutations 254
  - Base-pair substitutions 256
  - Frameshifts 256
  - Larger deletions and duplications 257
- Spontaneous mutation 258
  - Frequency 258
  - Mechanism of spontaneous mutation 260
- Chemical mutagenesis 261
  - Base analogues 261
  - Nitrous acid 262
  - Hydroxylamine and related compounds 264
  - Alkylating agents 265
  - Acridine compounds 266
  - Classification of mutants by use of chemical mutagens 268
  - Yield of mutants versus dose of mutagen 269
- Physical mutagens 270
  - Heat 270
  - X-rays 270
  - Ultraviolet light 271
- DNA repair and its role in mutagenesis 274
  - Radiation sensitive mutants in fungi 275
  - Conversion of single-strand mutations to double-strand mutations 278
- Differences between genetic sites in mutability 279
  - Within-gene effects 279
  - Between-gene effects 280
  - Special sensitivity at time of replication 281

<b>13 GENETIC CONTROL OF METABOLISM</b>	<b>282</b>
Analysis of auxotrophs 283	
Nutritional tests 283	
Accumulation of intermediates 285	
Absence or alteration of enzymes 287	
Metabolic shunts and by-passes 293	
Mutations affecting macromolecular synthesis 296	
Possible kinds of block in macromolecular synthesis 297	
Mutants with defects in DNA replication 298	
Mutants with defects in RNA replication 298	
Mutants defective in components of the protein synthesizing system 299	
Cell surface antigenic polysaccharides 302	
Mutants affected in utilization of major nutrients 302	
Nitrogen sources 303	
Carbon sources 306	
Phosphate nutrition 309	
Respiratory deficiencies 311	
Mutants resistant to toxic substances 312	
Transport mutants 312	
Mutational blocks in toxic metabolism 315	
Resistance of the target molecules 316	
Pigmentation mutants 318	
<b>14 GENES AND MACROMOLECULES</b>	<b>320</b>
Genetic determination of amino acid sequence in proteins 320	
<i>cyc-1</i> , the gene for iso-1-cytochrome c in yeast 321	
<i>am</i> , coding for NADP-specific glutamate dehydrogenase of <i>Neurospora</i> 323	
Mis-sense mutants 326	
Intra-gene suppression 327	
Chain-terminating mutations 332	
Chain initiation mutants 334	
Suppressors—mutations in genes for transfer RNA 336	
Different kinds of suppressors 336	
Nonsense suppressors 337	
Assignment of supersuppressors to genetic loci and tRNA species 339	
Suppression of mis-sense 342	
Involvement of molecules other than tRNA in translational suppression 344	
Genes and higher-order protein structure 345	
Effects of mutation on conformation and allosteric properties 345	
Allelic complementation in enzyme formation 348	
Molecular nature of dominance 353	
Complex enzymes 353	
Multifunctional enzymes of dual genetic determination 363	
Genes for tRNA and rRNA 367	
Transfer RNA 368	
Ribosomal RNA 369	
Messenger RNA 372	
<b>15 REGULATION OF PROTEIN SYNTHESIS</b>	<b>374</b>
Principles of regulation 374	
Regulatory systems in prokaryotes 374	

	Evidence for regulation of transcription in fungi	376
	Regulator genes	377
	Regulation in catabolic and anabolic pathways	379
	General regulation of nitrogen catabolism	380
	Nitrogen sources	385
	Arginine	391
	Biosynthesis of other amino acids	395
	Possible involvement of biosynthetic enzymes as regulatory proteins	399
	Regulation of carbon catabolism	401
	Regulation of the respiratory apparatus	401
	Genes involved in carbon catabolite repression	402
	Special carbon-catabolic pathways	404
	Sulphur nutrition in neurospora	409
	Regulation of phosphate nutrition	410
	Multiple controls of single enzymes	412
	'Hard times' enzyme	413
<b>16</b>	<b>GENETIC CONTROL OF VEGETATIVE GROWTH AND DEVELOPMENT</b>	<b>416</b>
	Control of mycelial morphology and cell wall structure	417
	Enzymes of the pentose phosphate cycle in morphological mutants	417
	Cell wall abnormalities	419
	Probable effects on membrane structure	420
	Differentiation of conidia	421
	Circadian rhythm	422
	Tropic responses	424
	Cell cycle mutants in Saccharomyces	426
	Nuclear cycle and mycelial extension in Aspergillus	429
<b>17</b>	<b>GENETIC CONTROL OF SEXUAL DEVELOPMENT</b>	<b>431</b>
	Sexual dimorphism	432
	Heterothallism with two mating types	433
	Yeast mating types and other labile systems	434
	Biochemistry of mating type in Hansenula	435
	Biochemistry of mating types in Saccharomyces	436
	Genetics of mating type in Saccharomyces	437
	Genetics of mating type in Schizosaccharomyces	441
	<i>a</i> locus in <i>Ustilago violacea</i>	446
	Mating-type switching in Chromocrea	447
	Functions of the mating type loci in tetrapolar species of Basidiomycetes	447
	Analysis of mating type functions by mutation	449
	Mechanism of allelic interaction in multiple-allele systems	454
	Mutational blocks in sexual development	454
	<i>Glomerella cingulata</i>	455
	<i>Sordaria species</i>	456
	Determination of sporulation in yeast	458
	Mutations causing abnormalities of development	459
	Effects on ascus and ascospore development in Neurospora	459
	Pigment mutants as markers for normal development	460

## PART 4

<b>DIRECT STUDY OF THE GENETIC MATERIAL</b>	<b>463</b>
<b>18 MITOCHONDRIAL GENETICS</b>	<b>465</b>
General features of mitochondria	465
Functions of mitochondrial DNA	467
Mitochondrial genetic markers	469
Respiratory deficiency	469
Mutants deficient in specific respiratory chain components	472
Antibiotic resistance	473
Assignment of mutations to genes	474
Patterns of recombination of mitochondrial markers	475
Polarity phenomenon and the mechanism of recombination	476
Mapping the mitochondrial genome	480
Recombination analysis	481
Co-retention of markers after petite deletions	483
Assessment of homologies by DNA-DNA hybridization	483
Restriction endonuclease mapping	485
Identification of genes by hybridization with their RNA products	485
<i>Schizosaccharomyces pombe</i>	487
Mitochondrial genetics of filamentous fungi	488
<i>Neurospora crassa</i>	488
<i>Aspergillus nidulans</i>	489
<b>19 EXTRAMITOCHONDRIAL EXTRACHROMOSOMAL INHERITANCE—   PLASMIDS, EPISOMES AND VIRUSES</b>	<b>492</b>
'Two micron' DNA of <i>Saccharomyces</i>	492
Other evidence for transposable genes	497
Transformation and an 'exosome' in <i>Neurospora</i>	499
'Killer'	500
<b>20 CLONING OF GENES FOR DIRECT CHEMICAL ANALYSIS</b>	<b>505</b>
General requirements for cloning	506
Techniques for cutting and joining double-stranded DNA	506
Cloning vehicles	508
Introduction of plasmid DNA into the <i>E. coli</i> cell	512
Cloning of yeast and <i>Neurospora</i> genes with defined biochemical functions	512
Complementation of <i>E. coli</i> auxotrophs by yeast and <i>Neurospora</i> DNA sequences	512
Hybrid plasmids carrying yeast genes for tRNA and rRNA	518
Use of nucleic acid 'probes' for preliminary enrichment with respect to specific gene sequences	521
Further analysis of cloned DNA segments	522
Possible hazards and their containment	524
<b>APPENDIX: SOME WIDELY USED CULTURE MEDIA</b>	<b>527</b>
<b>GLOSSARY OF GENETICAL TERMS</b>	<b>529</b>
<b>BIBLIOGRAPHY</b>	<b>535</b>
<b>INDEX</b>	<b>611</b>
