

Contents

1	Origins and development of cultivated plants	1
1.1	Selection and hybridization	1
1.2	Mendelian segregation and recombination	3
1.3	Interspecific hybridization	5
1.4	Polyploidy	7
2	Breeding Aims	13
2.1	Scientific breeding	13
2.2	Yield	13
2.3	Climate	14
2.4	Uniformity	15
2.5	Competition and consumer demand	15
2.6	New techniques	16
3	Breeding Methods: General	17
3.1	Protection	17
3.2	Isolation	17
3.3	Emasculation	18
3.4	Self-pollination	19
3.5	Cross-pollination	19
3.6	Selection in inbreeders	20
3.6.1	Single plant selection	20
3.6.2	Mass selection	21
3.6.3	Pedigree breeding	22
3.6.4	Bulk population breeding	22
3.6.5	Backcross breeding	23
3.7	Selection in outbreeders	23
3.7.1	Single plant selection	23
3.7.2	Mass selection	24
3.7.3	Recurrent selection	24
3.7.4	Backcross breeding	25
3.8	Quantitative inheritance	25
3.9	Polyploid inheritance	27
4	Breeding Methods: Special	30
4.1	Incompatibility	30
4.2	Interspecific sterility	32
4.3	Male sterility	32
4.4	Heterosis	33
4.5	Mutation breeding	36
4.6	Induced polyploidy	39

4.7	Chromosome manipulation	40
4.8	Disease resistance	41
4.9	Environmental control	44
4.10	Distribution and maintenance of new varieties	44
5	Breeding Principles	46
5.1	Fitness	46
5.2	Adaptability	50
5.3	Conservation of genetic variability	52
5.4	Centres of diversity	54
5.5	The future	56
