1	Introduction	page	7
1.1	Aspects of development		7
1.1.1	Differentiation		7
1.1.2	Pattern formation		7
1.1.3	Morphogenesis		8
1.2	Model systems		9
2	Pattern formation	10	
2.1	An outline of the problem	10	
2.2	General and theoretical aspects of pattern formation	10	
2.2.1	Polarity	10	
2.2.2	Axial gradients	11	
2.2.3	Apical dominance	11	
3	Specific examples of pattern formation	15	
3.1	The cellular slime mould: a simple bipartite pattern	15	
3.2	Hydra: a threshold-gradient model	17	
3.3	Limb development: ectodermal-mesenchymal interactions	19	
3.4	Limb regeneration: similarities between development and regeneration?	23	
3.5	The insect cuticle: studies in polarity	27	
3.6	The formation of nerve connections: a different type of problem?	29	
3.7	Primary embryonic induction	31	

4	Cell movement and its control in morphogenesis	page 33
4.1	The mechanism of cell movement	33
4.1.1	The cell membrane as the site of production of the force for cell movement	33
4.1.2	Haptotaxis: movement driven by interfacial forces	34
4.1.3	Generation of the motile force by structural elements in the cytoplasm	35
4.2	Types of pseudopodal activity	36
4.3	Controlling factors in cell movement	38
4.3.1	Contact inhibition	38
4.3.2	Contact paralysis	40
4.3.3	Contact guidance	40
4.3.4	Cellular adhesiveness	40
5	Specific examples of morphogenesis	44
5.1	Cleavage	44
5.2	The cellular slime mould	46
5.3	Sea urchin gastrulation	49
5.4	Invagination movements in amphibian development: gastrulation and neurulation	52
6	Intercellular communication	56
6.1	Intercellular junctions of low electrical resistance	56
6.2	Surface potential as a transducer in cellular interaction	57
6.3	Chemotaxis	57
