Preface xix

Plant Genome Constitutents and Their Organisation 1

R.B. Flavell and G. Moore

- 1 Introduction 1
- 2 Variation in Genome Size 2
- 3 Cytosine Methylation 3
- 4 Organisation of the Genome into Chromosomes 4
- 5 Large Genome Segments Defined by their Conserved Linear Order of Constituent Genes 5
- 6 Multimegabase Units 9
 - 6.1 Tandem arrays of repeats 9
 - 6.2 Telomeres 11
 - 6.3 Centromeres 12
- 7 Megabase Units Revealed by Cytosine-methylation-sensitive Restriction Endonucleases 12
- 8 Kilobase Units 13
 - 8.1 Transposable elements 13
 - 8.1.1 Elements encoding a transposase 13
 - 8.1.2 Retroelements 14
 - 8.2 Cytoplasmic organelle DNAs 15
 - 8.3 Genes 15
 - 8.4 Matrix attachment regions 17
 - 8.5 Origins of replication 18
- 9 Evolution of Repetitive Sequences—Implications for Genome Organisation 18
- 10 Future Perspectives 19
 - Essential Reading 20
 - References 20

PART I: LIBRARY CONSTRUCTION

2 cDNA Library Construction 29

P.J. Hussey and J. Hunsperger

- 1 Introduction 29
- 2 RNA Isolation 30
- 3 cDNA Synthesis 32
 - 3.1 One primer, random primers or both 37
 - 3.2 Type of reverse transcriptase 37
 - 3.3 Linkers, adapters or both 38
 - 3.4 Methylation, incorporation of 5-methyl-dCTP or neither 39
- 4 Vectors for cDNA Cloning 43

5	Gene Transfer to <i>E. coli</i>	46
5.1	Transformations and <i>E. coli</i> infection	46
5.2	<i>In vitro</i> lambda packaging and <i>E. coli</i> infection	46
6	Concluding Remarks	47
	Essential reading	47
	References	48
3	Genomic DNA Isolation and Lambda Library Construction	51
	<i>S.A.J. Warner</i>	
1	Introduction	51
2	Genome Organisation	52
2.1	Size of the nuclear genome	52
2.2	Complexity of the genome	52
2.3	Methylation of nuclear DNA	52
2.4	Organellar DNA organisation	53
3	Lambda as a Cloning Vector	54
3.1	Selection procedures	54
3.2	Replacement vectors	54
3.3	Insertional vectors	54
4	DNA Isolation	56
4.1	Total nucleic acid isolation	56
	PROTOCOL 1. CTAB DNA EXTRACTION OF PLANT DNA	57
	PROTOCOL 2. CsCl/EtBr PURIFICATION OF PLANT DNA	58
4.2	Organellar DNA Extractions	59
	PROTOCOL 3. NUCLEAR DNA PREPARATION	59
	PROTOCOL 4. ISOLATION OF CHLOROPLAST AND MITOCHONDRIAL DNA	60
4.3	Determination of DNA quantity and quality	61
5	Lambda Vectors and a Cloning Strategy	62
5.1	Which lambda vector?	62
5.2	Representative libraries	62
5.3	Cloning specific restriction fragments	63
6	Methodology of Library Construction	63
6.1	Restriction digestion of genomic DNA—a total digest	63
6.2	Random fragmentation of genomic DNA	66
6.3	Partial digestion with restriction enzymes	66
	PROTOCOL 5. PARTIAL DIGESTION OF PLANT GENOMIC DNA WITH <i>Mbo</i> I	67
6.4	Random shearing	67
6.5	Size fractionation of insert DNA	68
	PROTOCOL 6. SUCROSE GRADIENT FRACTIONATION OF PARTIALLY DIGESTED DNA	68
6.6	Dephosphorylation of the insert DNA	69
6.7	Ligation into lambda, packaging and plating	69
6.8	Analysis of library size and diversity	69
	PROTOCOL 7. MINI LAMBDA PHAGE PREPARATIONS	70
6.9	Libraries from alternative sources	70
7	Concluding Remarks	71
	Acknowledgments	72
	Essential Reading	72
	References	72
4	BAC, YAC and Cosmid Library Construction	75
	<i>H.-B. Zhang, S.-S. Woo and R.A. Wing</i>	
1	Introduction	75
2	Megabase-size DNA Isolation from Plants	77

CONTENTS

- 3 General Introduction to Procedures for the Construction of Cosmid, YAC and BAC Libraries 79
 - 3.1 Generation of large DNA fragments from megabase-size DNA 79
 - 3.2 Size selection of HMW DNA 80
 - 3.3 Vector preparation 80
 - 3.4 Transfer of recombinant DNA molecules into host cells 81
 - 3.5 Clone storage 81
- 4 Construction of Cosmid, BAC and YAC Libraries 81
 - 4.1 Cosmid libraries 81
 - 4.2 YAC libraries 84
 - 4.3 BAC libraries 88
- 5 Evaluation of Large DNA Fragment Cloning Systems: BACs versus YACs 92
- 6 BAC Plant Transformation Vectors? 93
- 7 Concluding Remarks 94
 - Acknowledgments 95
 - Essential Reading 95
 - References 95

PART II: LIBRARY SCREENING

5 Heterologous and Homologous Gene Probes 103

N.G. Halford

- 1 Introduction 103
- 2 Types of Probe 103
- 3 Procedure 104
- 4 Applications 104
- 5 The Use of cDNA, PCR Product and Gene Probes to Isolate Heterologous and Homologous Sequences 105
- 6 Practical Considerations for the Use of cDNA, PCR Product and Gene Probes 107
- 7 Limitations of Using cDNA, PCR Product and Gene Probes 111
- 8 The Use of Oligonucleotide Probes 111
- 9 Examples of the Use of Oligonucleotide Probes 112
- 10 Technical Hints 116
 - 10.1 Preparation of *Escherichia coli* cells for plating 116
 - 10.2 Plating the phage 116
 - 10.3 Plaque lifts 117
 - 10.4 Probe preparation 117
 - 10.5 Hybridisation and washing 118
 - 10.6 Plaque purification 118
 - 10.7 Phage DNA isolation 118
 - 10.8 Screening plasmid libraries by colony hybridisation 119
 - 10.9 Hybridisation with oligonucleotide probes 119
- 11 Concluding Remarks 120
 - Essential Reading 120
 - References 120

6 Differential Screening 125

P.A. Sabelli

- 1 Introduction 125
- 2 Method 129
 - 2.1 Preparing replica filters 129
 - 2.2 Hybridisation and post-hybridisation 132

3	Improved Procedures	133
3.1	Choice of samples	134
3.2	Hybridisation efficiency and signal intensity	134
3.3	Selecting non-hybridising clones	137
3.4	PCR-assisted screening	138
3.5	Signal evaluation	139
4	Alternative methods	140
5	Characterisation of Isolated Clones	140
6	Differential Screening Applied to Plants	143
7	Concluding Remarks	148
	Acknowledgments	148
	Essential Reading	148
	References	149
7	Expression Library Screening	157
	<i>I.E. Somssich and B. Weißhaar</i>	
1	Introduction	157
2	Considerations	159
3	Methodology	162
3.1	Construction of cDNA expression libraries	162
	PROTOCOL 1. RNA EXTRACTION AND POLY(A) ⁺ RNA PREPARATION	162
3.2	Screening of expression libraries using antibodies	164
	PROTOCOL 2. IMMUNOLOGICAL SCREENING	164
3.3	Screening of expression libraries using recognition site probes	166
	PROTOCOL 3. SOUTHWESTERN SCREENING	166
3.4	Methods confirming the specificity of the cloned gene products	169
4	Successful Application	171
5	Concluding Remarks	171
	Acknowledgment	172
	Essential Reading	172
	References	172
8	Functional Complementation in Yeast and <i>E. coli</i>	177
	<i>J.A.H. Murray and A.G. Smith</i>	
1	Introduction—A Brief History of Complementation	177
2	Requirements for Functional Complementation	181
3	Genes Isolated by Complementation Cloning	184
4	Considerations	184
4.1	Choice of biological process	186
4.2	Choice of organism and mutant strain	187
4.3	Alternative screening strategies	188
4.4	Choice of vector and library	190
4.4.1	Plasmid vectors	190
4.4.2	Phage vectors	191
4.4.3	Features of existing libraries	195
4.4.4	<i>S. pombe</i> vectors	196
4.4.5	Two-hybrid vectors	196
5	Transformation and Screening Procedures	196
5.1	Transformation and screening— <i>E. coli</i>	197
5.2	Transformation and screening—yeast	198
6	Possible Problems or Why Doesn't It Work?	200
7	Concluding Remarks	203
	Acknowledgments	204
	Appendix 1: Stock Centres for Obtaining Mutant Strains	204

Essential Reading	205
References	205

PART III: MAP-BASED CLONING**9 Classical Mutagenesis and Genetic Analysis 215***I. Vizir, G. Thorlby and B. Mulligan*

1	Introduction	215
2	Classical Mutagenesis Methods and Types of Mutations	217
3	Irradiation Mutagenesis	218
4	Chemical Mutagenesis	220
5	Mutation Frequency	221
6	Frequency of Appearance of Mutant Plants Within Individual M2 Families	222
7	Optimisation of Mutagenesis Experiments	223
7.1	Maximising the efficiency of isolation of mutants	224
7.1.1	Optional M2/M1 ratio	224
7.1.2	Minimum M2 population size required for the isolation of a new mutant	225
7.1.3	Comparison of different approaches towards maximising mutant isolation efficiency	226
7.2	The problem of multiple induced mutations and obtaining plants carrying a single-gene mutation	227
8	Genetic Analysis of a New Mutation	227
8.1	Linkage detection and preliminary mapping	228
8.2	Fine mapping	230
8.3	Factors affecting genetic mapping	232
8.4	Developments in genetic mapping	233
9	Concluding Remarks	234
	Acknowledgments	236
	Essential Reading	236
	References	236

10 Chromosome Walking 247*O. Leyser and C. Chang*

1	Introduction	247
2	The Basic Procedure	250
2.1	Identifying flanking DNA markers	250
2.1.1	Preliminary mapping and the choice of markers	250
2.1.2	Generating mapping populations	251
2.1.3	More detailed mapping	251
2.2	Obtaining linked recombinational breakpoints	252
2.2.1	Using flanking visible markers to reduce the workload	252
2.2.2	Alternative methods for recombinant isolation	253
2.2.3	Self-incompatible species	255
2.2.4	How many recombinants?	256
2.3	Isolating a series of contiguous DNA clones between the flanking markers	256
2.3.1	The first walk step	256
2.3.2	Assessing the progress of the walk	257
2.3.3	Potential problems	259
2.4	Identifying the desired gene within the contig	261
2.4.1	Plant transformation	261
2.4.2	Isolating candidate genes	264
3	General points	265

- 4 Prospects 266
- 5 Concluding Remarks 268
- Essential Reading 268
- References 269

PART IV: INSERTIONAL MUTAGENESIS

11 T-DNA-mediated Insertional Mutagenesis 275

K. Lindsey and J.F. Topping

- 1 Introduction 275
- 2 Theory and Application of T-DNA-mediated Insertional Mutagenesis Techniques 278
 - 2.1 Where and how does T-DNA integrate? 278
- 3 Insertional Mutagenesis by T-DNAs 280
 - 3.1 Tagging strategy 280
 - 3.2 Spectrum of mutants 284
- 4 Modified Insertional Mutagenesis: Gene Entrapment Techniques 286
 - 4.1 Promoter trapping 286
 - 4.2 Enhancer trapping 289
- 5 What do Gene-tagging Studies Tell Us About T-DNA Integration? 291
- 6 Practical Aspects of T-DNA-mediated Gene-Tagging 291
 - 6.1 Vectors 291
 - 6.1.1 Promoter trap vector p Δ gusBin19 292
 - 6.2 Transformation of *Arabidopsis thaliana* 292
 - 6.3 Screening for GUS fusion expression and mutants 292
 - PROTOCOL 1. MUTANT ANALYSIS 292
 - 6.4 Cloning strategies 293
 - 6.4.1 IPCR amplification of T-DNA flanking sequences 294
 - PROTOCOL 2. INVERSE PCR 294
- 7 Concluding Remarks 295
 - Acknowledgments 295
 - Essential Reading 295
 - References 295
 - Arabidopsis* Seed Resource Centres 299

12 Transposon-mediated Insertional Mutagenesis 301

M. Roberts

- 1 Introduction 301
 - 1.1 Transposable elements 301
 - 1.2 Transposon tagging 303
- 2 Requirements for and Limitations of Transposon Tagging 304
 - 2.1 Targets for mutagenesis 304
 - 2.2 Choice of tagging system 305
 - 2.3 Mutation frequency 305
 - 2.4 Germinal versus somatic activity 308
- 3 Methodology of Transposon Tagging 308
 - 3.1 Generation of mutants 308
 - 3.1.1 Targeted and non-targeted mutagenesis 308
 - 3.1.2 Tagging genes with known mutant phenotypes 309
 - 3.2 Cosegregation analysis 310
 - 3.3 Isolation of flanking DNA 312
 - 3.4 Cloning the wild-type gene 313
- 4 Tagging Using Endogenous Transposable Elements in Maize and *Antirrhinum* 313

CONTENTS

- 4.1 Choice of M0 stocks 313
- 4.2 Cloning tagged loci 314
 - 4.2.1 Examples from maize 314
 - 4.2.2 Examples from *Antirrhinum* 314
- 4.3 Native transposons in other species 315
- 5 Transposable Elements in Transgenic Plants 316
 - 5.1 Transposable elements in heterologous hosts 316
 - 5.2 Advantages of heterologous transposon tagging 316
 - 5.3 Construct design for heterologous tagging 318
 - 5.3.1 Transposase helpers 318
 - 5.3.2 Excision markers 319
 - 5.3.3 Markers for the selection of reinserted elements 319
 - 5.4 Gene-tagging in transgenic plants 319
- 6 Novel Applications for Transposable Elements 320
 - 6.1 Gene identification 320
 - 6.2 Identification of transposon insertions into known genes 320
 - 6.3 Genome manipulation 321
- 7 Sources of Material 321
 - 7.1 *Arabidopsis* 321
 - 7.2 Maize 322
 - 7.3 Plasmids 322
- 8 Concluding Remarks 322
 - Acknowledgments 322
 - Essential Reading 323
 - References 323

PART V: PCR-BASED CLONING

13 PCR Techniques 331

C. Thomas

- 1 Introduction 331
- 2 Setting up a PCR 333
 - 2.1 Template 333
 - 2.2 Polymerases 333
 - 2.3 Reagents 334
 - 2.4 PCR machines 335
 - 2.5 A basic PCR protocol 336
 - 2.6 Adapting the basic protocol 338
- 3 Preparation for PCR 338
 - 3.1 Generation of template 338
 - 3.2 Primer design 340
 - 3.3 Degenerate primers 342
 - 3.4 Add-on features 343
- 4 PCR Applications 345
 - 4.1 PCR of known sequences with two specific primers and reverse transcriptase PCR 345
 - 4.2 PCR with limited sequence information, inverse PCR, anchored PCR and RACE 347
 - 4.3 PCR of unknown sequences, RAPDS and differential display 350
 - 4.4 cDNA libraries using PCR 351
 - 4.5 PCR-based mutagenesis 352
 - 4.6 Deletions and insertions by PCR 353
 - 4.7 Sequencing and characterisation of PCR products 353
 - 4.8 Cloning PCR products 354
 - 4.9 Screening libraries, colonies and plaques 356

4.10	Screening transgenic plants	357
4.11	Quantitative PCR	358
5	Troubleshooting	359
5.1	Controls	359
5.2	Too many or too few bands	359
5.3	Contamination	360
6	Concluding Remarks	360
	Acknowledgments	360
	Essential Reading	361
	References	361
14	cDNA and Genomic Subtraction	369
	<i>M.P. Bulman and S.J. Neill</i>	
1	Introduction	369
2	Subtractive Approaches	370
2.1	cDNA subtraction	372
2.2	Genomic subtraction	372
2.3	Preparation of target and driver nucleic acids	372
2.4	Hybridisation	372
2.5	Separation	373
3	cDNA Subtraction	374
3.1	Preparation of driver and target NAs	374
3.2	Hybridisation	380
3.3	Separation	381
3.4	Uses of the subtracted cDNA	382
4	cDNA Subtraction Protocol	382
4.1	cDNA preparation	383
4.2	Adapter-primer ligation	383
4.3	PCR amplification	384
4.4	Biotinylation of cDNA	385
4.5	Hybridisation	386
4.6	Separation of biotinylated and non-biotinylated hybrids	386
4.7	Library construction	387
4.8	Screening of conventional library with subtracted probe	387
4.9	Controls	388
5	Identification of cDNAs Using Subtractive Hybridisation	390
6	Genomic Subtraction	390
7	Concluding Remarks	393
	Acknowledgments	394
	Essential Reading	394
	References	394

PART VI: SEQUENCING PROJECTS

15 EST and Genomic Sequencing Projects 401

R. Cooke, R. Mache and H. Höfte

1	Introduction	401
2	cDNA Sequencing Projects	402
2.1	Systematic sequencing in plants	402
2.2	Plant cDNA libraries	403
2.3	Sequencing strategies	405
2.4	Quality of EST data	405
2.4.1	Accuracy	405
2.4.2	Vector contamination	406

CONTENTS

	2.4.3 Redundancy	406
	2.5 Data analysis	407
3	Gene Identification	408
	3.1 ESTs similar to known genes	408
	3.2 Identification of new genes	410
	3.3 Abundantly expressed genes	411
4	How Can ESTs be Used?	411
	4.1 Isolation of genes from other plant species corresponding to ESTs	411
	4.2 Correlation of map positions of ESTs with the position of mutant loci	412
5	EST Databases and Stock Centres	413
	5.1 Network search tools	413
	5.2 Searching for ESTs using keywords	414
	5.3 Searching for ESTs matching a DNA or a protein sequence	414
	5.4 Obtaining sequenced cDNA clones	415
	5.5 Obtaining mapping information	415
6	Sequencing Genomic DNA	415
	6.1 Why sequence the genome?	415
	6.2 Genomic sequencing strategies	416
	6.3 Genome analysis	416
7	Concluding Remarks	417
	Acknowledgments	417
	Essential Reading	417
	References	418
