

Contents

1. Heuristic Introduction to the Discrete Memoryless Channel . . .	1
2. Combinatorial Preliminaries	6
2.1. Generated sequences	6
2.2. Properties of the entropy function	10
Remarks	14
3. The Discrete Memoryless Channel	14
3.1. Description of the channel	14
3.2. A coding theorem	17
3.3. The strong converse	19
3.4. Strong converse for the binary symmetric channel	21
3.5. The finite-state channel with state calculable by both sender and receiver	22
3.6. The finite-state channel with state calculable only by the sender	27
Remarks	30
4. Compound Channels	33
4.1. Introduction	33
4.2. The canonical channel	35
4.3. A coding theorem	36
4.4. Strong converse	40
4.5. Compound d.m.c. with c.p.f. known only to the receiver or only to the sender	40
4.6. Channels where the c.p.f. for each letter is stochastically determined	43
4.7. Proof of Theorem 4.6.4.	47
4.8. The d.m.c. with feedback	49
Remarks	52
5. The Discrete Finite-Memory Channel	52
5.1. The discrete channel	52
5.2. The discrete finite-memory channel	55
5.3. The coding theorem for the d.f.m.c.	57
5.4. Strong converse of the coding theorem for the d.f.m.c. .	58
5.5. Rapidity of approach to C in the d.f.m.c.	59
5.6. Discussion of the d.f.m.c.	59
Remarks	61

6. Channels with Arbitrarily Varying Channel Probability Functions	62
6.1. Introduction	62
6.2. Necessary and sufficient conditions for a positive rate of transmission	62
6.3. Remarks on the capacity of an arbitrarily varying channel	66
6.4. The capacity C of an arbitrarily varying channel when $b=2$	67
6.5. Certain results for the general arbitrarily varying channel	73
Remarks	75
7. General Discrete Channels	76
7.1. Alternative description of the general discrete channel	76
7.2. The method of maximal codes	77
7.3. The method of random codes	82
7.4. Weak converses	85
7.5. Digression on the d.m.c.	88
7.6. Discussion of the foregoing	91
7.7. Channels without a capacity	92
7.8. Strong converses	94
7.9. The strong converse for the d.m.c. revisited	96
Remarks	104
8. The Semi-Continuous Memoryless Channel	104
8.1. Introduction	104
8.2. A coding theorem and its strong converse	108
9. Continuous Channels with Additive Gaussian Noise	109
9.1. A continuous memoryless channel with additive Gaussian noise	109
9.2. Message sequences within a suitable sphere	111
9.3. Message sequences on the periphery of the sphere or within a shell adjacent to the boundary	114
9.4. Another proof of Theorems 9.2.1 and 9.2.2	115
Remarks	117
10. Mathematical Miscellanea	118
10.1. Introduction	118
10.2. The asymptotic equipartition property	118
10.3. Admissibility of an ergodic input for a discrete finite-memory channel	122
11. Fundamentals of Rate Distortion Theory	125
11.1. Introduction	125
11.2. The approximation theorem	126
11.3. Converse of the approximation theorem	128

11.4. Summary of the previous results	130
11.5. The rate distortion function when side information is available	131
Remarks	133
12. Source Coding	134
12.1. Separate coding to span the product of two spaces . .	134
12.2. Source coding with side information at the decoder . .	139
12.3. Encoding assisted by a common channel	143
Remarks	144
13. Source Coding and Rate Distortion	145
13.1. The problem of Section 12.3 for rate distortion	145
13.2. The rate distortion function for source coding with side information at the decoder	149
14. Multiple Access Channels	155
14.1. Description of the problem	155
14.2. A coding theorem	156
14.3. Converse of the coding theorem	158
14.4. Miscellaneous remarks	160
15. Degraded Broadcast Channels	161
15.1. Formulation of the problem	161
15.2. A coding theorem	162
15.3. Beginning of the proof of the strong converse	165
15.4. Proof of the weak converse	167
15.5. Miscellaneous remarks	169
References	171
