

Contents

	Preface to the second edition	xv
	Preface to the first edition	xvii
1	Randomization	1
1.1	The idea of a randomization test	1
1.2	Examples of randomization tests	3
1.3	Aspects of randomization testing raised by the examples	13
1.3.1	Sampling the randomization distribution or systematic enumeration	14
1.3.2	Equivalent test statistics	15
1.3.3	Significance levels for classical and randomization tests	16
1.3.4	Limitations of randomization tests	17
1.4	Confidence limits by randomization	17
1.5	Applications of randomization in biology	19
1.5.1	Single species ecology	20
1.5.2	Genetics, evolution and natural selection	20
1.5.3	Community ecology	21
1.6	Randomization and observational studies	22
1.7	Chapter summary	23
2	The jackknife	24
2.1	The jackknife estimator	24
2.2	Applications of jackknifing in biology	29
2.2.1	Single species analyses	29
2.2.2	Genetics, evolution and natural selection	29
2.2.3	Community ecology	30
2.3	Chapter summary	33
3	The bootstrap	34
3.1	Resampling with replacement	34
3.2	Standard bootstrap confidence limits	34

x Contents

3.3	Simple percentile confidence limits	39
3.4	Bias-corrected percentile confidence limits	44
3.5	Accelerated bias-corrected percentile limits	49
3.6	Other methods for constructing confidence intervals	56
3.7	Transformations to improve bootstrap- <i>t</i> intervals	59
3.8	Parametric confidence intervals	61
3.9	A better estimate of bias	61
3.10	Bootstrap tests of significance	62
3.11	Balanced bootstrap sampling	64
3.12	Applications of bootstrapping in biology	65
3.12.1	Single species ecology	65
3.12.2	Genetics, evolution and natural selection	65
3.12.3	Community ecology	66
3.13	Further reading	66
3.14	Chapter summary	67
4	Monte Carlo methods	69
4.1	Monte Carlo tests	69
4.2	Generalized Monte Carlo tests	72
4.3	Implicit statistical models	76
4.4	Applications of Monte Carlo methods in biology	76
4.4.1	Single species ecology	77
4.4.2	Genetics and evolution	77
4.4.3	Community ecology	77
4.5	Chapter summary	78
5	Some general considerations	79
5.1	Questions about computer-intensive methods	79
5.2	Power	80
5.3	Number of random sets of data needed for a test	80
5.4	Determining a randomization distribution exactly	84
5.5	The number of replications for confidence intervals	87
5.6	More efficient bootstrap sampling methods	88
5.7	The generation of pseudo-random numbers	89
5.8	The generation of random permutations	89
5.9	Chapter summary	90
6	One- and two-sample tests	91
6.1	The paired comparisons design	91
6.2	The one-sample randomization test	96
6.3	The two-sample randomization test	97
6.4	Bootstrap tests	99
6.5	Randomizing residuals	101

6.6	Comparing the variation in two samples	103
6.7	A simulation study	105
6.8	The comparison of two samples on multiple measurements	108
6.9	Further reading	112
6.10	Chapter summary	113
6.11	Exercises	115
7	Analysis of variance	117
7.1	One-factor analysis of variance	117
7.2	Tests for constant variance	119
7.3	Testing for mean differences using residuals	120
7.4	Examples of more complicated types of analysis of variance	125
7.5	Procedures for handling unequal variances	141
7.6	Other aspects of analysis of variance	142
7.7	Further reading	143
7.8	Chapter summary	144
7.9	Exercises	145
8	Regression analysis	148
8.1	Simple linear regression	148
8.2	Randomizing residuals	149
8.3	Testing for a non-zero β -value	151
8.4	Confidence limits for β	153
8.5	Multiple linear regression	154
8.6	Alternative randomization methods with multiple regression	156
8.7	Bootstrapping and jackknifing with regression	166
8.8	Further reading	167
8.9	Chapter summary	169
8.10	Exercises	170
9	Distance matrices and spatial data	172
9.1	Testing for association between distance matrices	172
9.2	The Mantel test	174
9.3	Sampling the randomization distribution	175
9.4	Confidence limits for regression coefficients	178
9.5	The multiple Mantel test	179
9.6	Other approaches with more than two matrices	181
9.7	Further reading	194
9.8	Chapter summary	199
9.9	Exercises	200

xii Contents

10	Other analyses on spatial data	205
10.1	Spatial data analysis	205
10.2	The study of spatial point patterns	205
10.3	Mead's randomization test	206
10.4	Tests for randomness based on distances	211
10.5	Testing for an association between two point patterns	213
10.6	The Besag-Diggle test	214
10.7	Tests using distances between points	216
10.8	Testing for random marking	218
10.9	Further reading	220
10.10	Chapter summary	221
10.11	Exercises	222
11	Time series	225
11.1	Randomization and time series	225
11.2	Randomization tests for serial correlation	226
11.3	Randomization tests for trend	231
11.4	Randomization tests for periodicity	237
11.5	Irregularly spaced series	244
11.6	Tests on times of occurrence	246
11.7	Discussion on procedures for irregular series	248
11.8	Bootstrap and Monte Carlo tests	252
11.9	Further reading	254
11.10	Chapter summary	256
11.11	Exercises	258
12	Multivariate data	260
12.1	Univariate and multivariate tests	260
12.2	Sample means and covariance matrices	260
12.3	Comparison of sample mean vectors	261
12.4	Chi-squared analyses for count data	270
12.5	Principal components analysis and other one-sample methods	273
12.6	Discriminant function analysis	275
12.7	Further reading	279
12.8	Chapter summary	279
12.9	Exercises	280
13	Survival and growth data	284
13.1	Bootstrapping survival data	284
13.2	Bootstrapping for variable selection	286
13.3	Bootstrapping for model selection	288
13.4	Group comparisons	289

13.5	Growth data	289
13.6	Further reading	295
13.7	Chapter summary	296
13.8	Exercises	297
14	Non-standard situations	300
14.1	The construction of tests in non-standard situations	300
14.2	Species co-occurrences on islands	300
14.3	An alternative generalized Monte Carlo test	308
14.4	Examining time changes in niche overlap	312
14.5	Probing multivariate data with random skewers	319
14.6	Ant species sizes in Europe	323
14.7	Chapter summary	328
15	Bayesian methods	330
15.1	The Bayesian approach to data analysis	330
15.2	The Gibbs sampler and related methods	331
15.3	Biological applications	336
15.4	Further reading	336
15.5	Chapter summary	337
15.6	Exercise	337
16	Conclusion and final comments	338
16.1	Randomization	338
16.2	Bootstrapping	339
16.3	Monte Carlo methods in general	339
16.4	Classical vs. Bayesian inference	340
	Appendix: software for computer-intensive statistics	341
	References	343
	Author index	377
	Subject index	388
