Preface	xiii	
Chapter 1. General Background and the Diversity of Genetic Variation	1	
I. Approaches to Population Genetics	2	
II. Introduction to Some Genetic Topics	6	
a. Some Genetic Terms	6	
b. The Genetic Code	10	
c. Structure of the Genome and a Typical Eukaryotic Gene	11	
III. Introduction to Some Quantitative Topics	14	
a. Models	14	
b. Means, Variances, and Confidence Intervals	17	
c. Probability	22	
d. Matrices	26	
IV. Genetic Variation	27	
a. Allozyme Variation	31	
b. Nucleotide and Amino Acid Sequence Variation	35	
c. Visible Polymorphisms	43	
d. Mutants, Lethals, and Fitness Modifiers	45	
e. Polygenic or Quantitative Traits	53	
Chapter 2. Measures of Genetic Variation	61	
I. The Hardy-Weinberg Principle	63	
a. Two Alleles	64	
b. Multiple Alleles	70	
II. Different Frequencies Between the Sexes	72	
a. Autosomal Genes	72	
b. X-linked Genes or Genes in Haplo-Diploid Organisms	75	
III. Estimates of Allele Frequency	79	
IV. Testing Hardy-Weinberg Proportions	90	
V. Measures of Genetic Variation	97	
a. Heterozygosity	97	
b. Other Measures	102	
VI. Measures of Nucleotide and Amino Acid Diversity	104	
VII. Measures of Genetic Distance	106	
Chapter 3. Selection: An Introduction	113	
I. The Basic Selection Model	119	
a. Recessive Lethal	123	
b. Selection Against Recessives	127	
c. Intermediate Dominance (Additivity)	130	
d. Selection Against Dominants	134	
e. General Dominance	135	
f. Heterozygote Advantage (Overdominance)	139	
g. Heterozygote Disadvantage (Underdominance)	144	
II. Estimation of Selection	147	
a. Viability Selection	147	
b. Genotype Frequencies and Some Caveats	150	
c. Deviations from Mendelian Expectations	152	

d. Relative Risk	155	h. Relatedness	271
III. Relaxing Some Genetic Assumptions	157	i. Kin Selection	278
a. Multiple Alleles	158	II. Inbreeding and Selection	279
b. X-Linked Genes or Genes in Haplo-Diploid Organisms	164	a. Inbreeding Depression	279
		b. Change in Allele Frequency and Conditions for a Polymorphism	286
		III. Positive-Assortative Mating	292
Chapter 4. Selection: Advanced Topics	173		
I. Viability Selection	176	Chapter 6. Genetic Drift and Effective Population Size	299
a. Viability Differences in Different Life Stages	176	I. The Effect of Genetic Drift	304
b. Viability Differences in the Sexes	177	a. The Probability Matrix Approach	310
c. Maternal-Fetal Interactions	180	II. Effective Population Size	318
d. Antagonistic Pleiotropy	184	a. Separate Sexes	320
II. Sexual Selection	188	b. Variation in Number of Gametes	324
a. Negative-Assortative Mating	190	c. Variation in Time	329
b. Rare-Male Mating Advantage	192	d. Other Factors That May Influence Effective Population Size	334
c. Female Choice, MHC, and Negative Assortative Mating	195	e. Genetic Techniques for Estimating Effective Population Size	336
III. Gametic Selection	196	f. The Founder Effect and Bottlenecks	342
a. Meiotic Drive or Segregation Distortion	197	III. Selection in Finite Populations	349
b. Self-Incompatibility Alleles	200	a. Directional Selection	349
IV. Ecological Genetics and Balancing Selection	204	b. Balancing Selection	353
a. Spatial Variation	210		
b. Temporal Variation	215	Chapter 7. Mutation	357
c. Frequency-Dependent Selection	221	I. Allele Frequency Change Caused by Mutation	362
d. Host-Pathogen Interactions	228	a. Forward and Backward Mutation	364
		b. The Fate of a Single Mutation	366
Chapter 5. Inbreeding	237	II. Mutation-Selection Balance	368
I. Inbreeding	238	a. Recessive Mutants	368
a. Self-Fertilization	245	b. Other Levels of Dominance and Mutation Load	372
b. Partial Self-Fertilization	249	III. Mutation in a Finite Population	376
c. Estimates of Outcrossing, Self-Fertilization, and Biparental Inbreeding	252	a. Neutrality	376
d. Regular Systems of Inbreeding	259	b. Selection	385
e. Other Levels of Partial Inbreeding	262	IV. Estimation of Mutation Rates	390
f. Estimation of Inbreeding from Pedigrees	264	a. Dominant or Codominant Mutants	391
g. The Chain-Counting Technique	266	b. Recessive Mutants	395

- c. Mutation Accumulation Estimates 396
- d. Factors Influencing the Mutation Rate 400

Chapter 8. Neutral Theory and Coalescence 407

- I. Neutral Theory and Predictions about Molecular Variation 408
 - a. Balancing Selection 408
 - b. The Neutral Theory 411
 - c. The Molecular Clock 416
- II. Tests of the Neutral Theory and Evidence of Selection 428
 - a. Ewens-Watterson Test 429
 - b. Tajima Test 433
 - c. Hudson-Kreitman-Aguade (HKA) Test 436
 - d. McDonald-Kreitman (MK) Test 440
 - e. Synonymous and Nonsynonymous Nucleotide Substitutions 443
 - f. Codon Usage 449
- III. Coalescence and Gene Genealogies 452
 - a. An Introduction to Coalescence 452
 - b. Estimating Effective Population Size 462

Chapter 9. Gene Flow and Population Structure 469

- I. Population Structure 471
 - a. The Continent-Island Model 472
 - b. General Model 476
 - c. Wahlund's Principle 479
 - d. Gametic and Zygotic Gene Flow 482
- II. Estimation of Gene Flow and Population Structure 483
 - a. Hybrid Populations 484
 - b. F Coefficients and Other Differentiation Measures 488
 - c. Sex Differences in Gene Flow 495
- III. Population Structure and Genetic Drift 499
 - a. The Continent-Island or Island Model 500

- b. The Stepping-Stone Model and Isolation by Distance 504
- c. Metapopulation 507
- IV. Gene Flow and Selection 509
 - a. The Continent-Island Model 510
 - b. Variable Selection and Clines in a Substructured Population 517

Chapter 10. Linkage Disequilibrium and Recombination 525

- I. Linkage Disequilibrium 527
 - a. The Linkage Disequilibrium Measure, D 528
 - b. Other Measures of Linkage Disequilibrium 532
 - c. Rate of Recombination, c 537
- II. The Influence of Genetic Drift, Mutation, Inbreeding, and Gene Flow in Linkage Disequilibrium 541
 - a. Genetic Drift 541
 - b. Mutation 545
 - c. Inbreeding 548
 - d. Gene Flow 551
- III. Multilocus Selection 554
 - a. Fitness Epistasis 555
 - b. Directional Selection at Two Loci 557
 - c. General Two-Locus Polymorphisms 559
 - d. Selection at More than Two Loci 566
- IV. Genetic Background, Genetic Hitchhiking and Related Topics 567
 - a. Genetic Background 568
 - b. Genetic Hitchhiking 571
 - c. Selective Sweeps and Background Selection 576
 - d. Age of a Favorable Allele 580
 - e. Advantages and Disadvantages of Recombination (Sex) 583
- V. Estimation of Linkage Disequilibrium 585
 - a. Direct Identification of Gametes 588
 - b. Two Codominant Loci 589
 - c. Extension to Multiple Alleles 591

**Chapter 11. Molecular Population Genetics
and Evolution 597**

- I. Molecular Phylogenetics 598
 - a. Unweighted Pair Group Method (UPGMA) 601
 - b. Neighbor-Joining (NJ) Method 605
 - c. Maximum Parsimony 609
 - d. Phylogeography 611
- II. Paternity Analysis and Individual Identity 621
 - a. Paternity Exclusion 622

- b. Paternity Assignment 630
- c. Individual Identity 636
- d. Population Assignment 646
- III. Identifying Genes Influencing Quantitative Traits 650
 - a. Identifying QTLs by Crosses 652
 - b. Haplotype Mapping 658

Bibliography 664

Answers to Numerical Problems 721

Index 725
