Table of contents Contributors Preface Introduction

### Chapter

1. Metapopulation biology: Past, present, and future Chapter
2. Metapopulation dynamics: Perspectives from landscape ecology Chapter
3. Continuous-space models for population dynamics Metapopulation ecology Chapter
4. Metapopulation dynamics in highly fragmented landscapes Chapter
5. Application of stochastic patch occupancy models to real metapopulations Chapter
6. From metapopulations to metacommunities Metapopulation genetics Chapter
7. Selection and drift in metapopulations Chapter
8. Metapopulations and coalescent theory Chapter
9. Metapopulation quantitative genetics: The quantitative genetics of population differentiation Evolutionary dynamics in metapopulations Chapter
10. Life history evolution in metapopulations Chapter
11. Selection in metapopulations: The co-evolution of phenotype and context Chapter
12. Speciation in metapopulations Integration and applications Chapter
13. Causes, mechanisms and consequences of dispersal Chapter
14. Mechanisms of population extinction Chapter
15. Multilocus genotype methods for the study of metapopulation processes Chapter
16. Ecological and evolutionary consequences of source-sink population dynamics Chapter
17. Metapopulation dynamics of infectious diseases Chapter
18. Towards a metapopulation concept for plants Chapter
19. Long-term study of a plant-pathogen metapopulation Chapter
20. Metapopulation dynamics in changing environments: Butterfly responses to habitat and climate change Chapter
21. Inferring pattern and process in small mammal metapopulations: Insights from ecological and genetic data Chapter
22. Metapopulation dynamics and reserve network design Chapter
23. Viability analysis for endangered metapopulations: A diffusion approximation approach Bibliography Index
