List of tables	xv
List of text boxes	xvi
Preface	xvii
Nomenclature and terminology	xxi

PART I People and plants: one hundred millennia of coevolution	1
1 Early human societies and their plants	3
Introduction	3
Why agriculture?	5
Gradual transitions	7
Human beginnings	9
Climate, migration, and food	11
Climatic change and small-scale migrations	11
Moving down the food chain	17
2 Plant management and agriculture	20
Introduction	20
The rise of cereals after 25,000 BP	20
A warm interlude after 15,500 BP	26
The Kebaran hunter-gatherer culture	26
The early Natufians and sedentism	28
Non-agricultural plant management	30
The remarkable Kumeyaay people	31
Plant management does not necessarily lead to agriculture	32
3 How some people became farmers	36
Introduction	36
A cold, dry shock—the Younger Dryas Interval	36
Biological and human consequences	38
A stimulus towards sedentism?	39
The human response	44
The later Natufians	44
Domestication of canids	45
Early Abu Hureyra cultures, 14,000 to 11,000 BP	46
Plant domestication and acquisition of agriculture are reversible processes	49

PART II Crops and genetics: 90 million years of plant evolution

4 Plant genomes

Introduction

Darwin, de Candolle, and Vavilov

Origin and domestication of the major crops

Polyploidy and crops

What is polyploidy? 60

Autopolyploidy and allopolyploidy 62

Evolutionary significance of polyploidy and hybridization 63

Polyploidy and agriculture 64

5 Fluid genomes, uncertain species, and the genetics of crop domestication

Introduction

Fluid genomes, 'extra' DNA, and mobile genes in plants

The fluid genome 65

What is 'extra' DNA? 66

Gene transfer between plant and non-plant genomes 67

Biological species

Revising our concept of the 'species' 71

The domestication syndrome

Domestication-related genes 74

Clustering and regulation of domestication-related genes 74

6 The domestication of cereal crops

Introduction

Wheat

The three genomes of crop wheats 79

Wheat adapts to cultivation 83

Barley

Rye and oats

Rye 87

Oats 87

Millet

Rice

Maize

A complex genome 92

Evolution from teosinte 92

Sorghum

7 The domestication of non-cereal crops

Introduction

Pulses

Lentils 96

Peas 97

Beans 98

Potatoes and other Solanaceae

- Potatoes 99
- Other solanaceous crops 100
- Brassicacae
 - The multiple genomes of the brassicacae 102
 - A uniquely versatile group of crops 104

PART III People and plants in prehistoric times: ten millennia of climatic and social change

8 People and the emergence of crops

- Introduction
- Emergence of cereal crops in the Near East
- Rice and millet come to eastern Asia
 - Rice 111
 - Millet 114
- Maize arrives in Mesoamerica
- Other cultures, other crops
 - Squash 118
 - Potatoes 119
 - Pulses 120
 - Soybeans 121

9 Agriculture: a mixed blessing

- Introduction
- Early agriculture and human nutrition
 - People get smaller but live a little longer 127
 - Sexual differentiation of labour 128
 - Impact of nutrient deficiencies 129
- Human genetic changes in response to agriculture
 - Partial pathogen tolerance: bad for individuals but good for societies 130
 - The sickle-cell trait and other antimalarial mutations 131
 - Vitamin D, pale skin, and lactose tolerance 132
 - Dental changes and the recent 'maxillary shrinkage' 134
- How did the sickly Neolithic farmers prevail?
- Livestock domestication

10 Evolution of agrourban cultures: I The Near East

- Introduction
- Climatic context of the Holocene: punctuated stability
 - The climatic event of *c.* 8200 BP 141
 - The climatic event of *c.* 5200 BP 148
 - The climatic event of *c.* 4200 BP 150
- Establishment and spread of farming: 11,500 to 8000 BP
 - Beginnings—from Abu Hureyra to Çatalhöyük 151
- Elites, cities, and irrigation: 8000 to 5200 BP
 - The Hassunians 155
 - Halafian culture 155
 - The Samarrans 156

- Ubaid culture 157
- The early Uruk period 158
- Bureaucracy, empire, and drought: 5200 to 4000 BP
- The later Uruk period 162
- Recovery in the North 167
- Rise of the Akkadian Empire 167
- The fall of Akkad and Ur 170
- Renewed recovery 173

11 Evolution of agrourban cultures: II South and east Asia

- Introduction
- The Indus Valley
 - Beginnings 174
 - Rise of the Harappan cities after 5500 BP 177
 - The collapse of c. 4000 BP 178
- China
 - Prefarming cultures in north China 181
 - Beginnings of agriculture 185
 - Dadiwan, Yangshao, Longshan, and Qijia cultures: 8000 to 4000 BP 185
 - The collapse of c. 4000 BP 186
 - Rice farming in southern China 187

12 Evolution of agrourban cultures: III Africa, Europe, and the Americas

- Introduction
- Africa
 - The Sahara 190
 - The Great Drought of the mid-Holocene 191
 - The Nile Valley 195
 - The rest of Africa 196
- Europe
 - Linearbandkeramik cultures: 7500 BP and beyond 197
 - The rise of elites, 6000 to 3500 BP 203
- The Americas
 - Mesoamerica 204
 - South America 212
 - North America 215

PART IV People and plants in historic times: globalization of agriculture and the rise of science

13 Crop management in the classical and medieval periods

- Introduction
- Agriculture during the classical period: 2000 BCE to 500 CE
 - Old Babylon and Assyria 221
 - The Neo-Babylonians 223
 - The Hellenistic Era 224
 - The Romans 226

Medieval agriculture: 500 to 1500 CE	
Byzantine and Arab cultures	227
Europe: 500 to 1300 CE	229
The Little Ice Ages	230
Societal context of practical plant manipulation	

14 Agricultural improvement and the rise of crop breeding

Introduction	
Breeding	
What is breeding?	234
Empirical breeding and biotechnology	240
Evolution of modern agricultural economies	
Renaissance and neonaissance	241
Improvements and enclosures	243
Applying the new knowledge	
The birth of practical scientific breeding	245

15 Imperial botany and the early scientific breeders

Introduction	
The English revolution	
Botany in the ascendant: the seventeenth and eighteenth centuries	
Role of the botanical garden	250
Economic and political botany	253
Beginnings of scientific breeding	
Plant reproduction and systematic botany	256
Hybrids and their importance in crop improvement	257
Mutations and their uses	259

16 Agricultural improvement in modern times

Introduction	
The achievements of modern agriculture	
Improving crop management	
Inputs	263
Intensification	265
Genetic variation and its manipulation for crop improvement	
Quantitative genetics	268
Creating new variation	
Hybrids and wide crosses	269
Mutagenesis	269
Transgenesis	272
Screening and selection	
Phenotypic and chemical markers	272
DNA-based markers	274
Domesticating new crops—a new vision for agriculture	
Why domesticate new crops?	275
A new vision	278

17 The future of agriculture and humanity

Introduction

Agriculture and human population fluctuations

The short- to medium-term future

The far future—an uncertain environment

Can we ensure that agriculture survives in the long term?

People, plants, and genes in the next 100,000 years

Notes
