Basic Structures of Some Important Cell Wall Polymers	xvi
Preface	xvii
1 Introduction to the growing cell wall	1
1.1 Background	1
1.1.1 Reasons for studying primary cell walls	1
1.1.2 Definitions	2
1.1.3 Chemical composition and biological function	4
1.1.4 The formation and growth of primary cell walls	5
1.2 Isolation and purification of plant cell walls	7
1.2.1 Isolation of walls by washing in organic solvents	8
1.2.2 Homogenisation of fresh tissue in aqueous buffers	11
1.2.3 Homogenisation in glycerol	14
1.2.4 Fractionation of different cell walls	14
2 Radioactive labelling of cell walls	15
2.1 The principles of radioactive labelling	15
2.1.1 Analysis of picogramme quantities	15
2.1.2 Specific versus non-specific labelling	16
2.1.3 Maximising specific activity in vivo: continuous labelling	17
2.1.4 Tracing of metabolic pathways: Pulse-labelling	22
2.1.5 Simple pulse versus pulse-chase labelling	22
2.2 Methods of feeding radioactive precursors (tissue cultures)	24
2.3 Methods of feeding radioactive precursors (intact plants)	28
2.3.1 Supply of inorganic precursors	28
2.3.2 Infiltration of organic precursors	29
2.4 Uptake of precursors	31
2.5 Activation and interconversion of precursors	33
2.6 Determination of wall polymer synthesis	33
2.6.1 Measurement of radioactive polymers	33
2.6.2 Calculation of the rate of polymer synthesis: Pools	36
2.7 Introduction to plant tissue culture techniques	37
2.7.1 Initiation of a callus culture	37
2.7.2 Characteristics of callus cultures	40
2.7.3 Establishment and maintenance of a suspension culture	40
2.7.4 Differentiation	41
2.7.5 Synchronisation of cell division	41

2.7.6	Isolation of protoplasts	41
2.8	Introduction to the use and detection of radioactivity	42
2.8.1	Basic concepts	43
2.8.2	Methods for the detection of radioactivity	44
3	Wall polymers: extraction and fractionation	49
3.1	Polysaccharides	49
3.1.1	Chemistry of sugars	49
3.1.2	Glycosidic linkages	52
3.1.3	Properties of polysaccharides	53
3.2	Chemistry of proteins and glycoproteins	57
3.3	Wall phenolics	58
3.3.1	Chemistry of phenolics	58
3.3.2	Linkages involving phenolics	60
3.3.3	Properties of pure phenolics	60
3.3.4	Properties of phenol—polymer conjugates	64
3.4	Extraction of wall polymers	64
3.4.1	Extraction of polysaccharides	64
3.4.2	Extraction of glycoproteins	71
3.4.3	Extraction of phenol—polymer conjugates and lignin	73
3.5	Separation of wall polymers	75
3.5.1	Removal of extractant: de-salting	75
3.5.2	Separation of polymers on the basis of size	79
3.5.3	Separation of polymers on the basis of charge	83
3.5.4	Separation of polymers on the basis of density	87
3.5.5	Separation of polymers by their affinity properties	88
3.5.6	Separation by differential precipitation/partitioning	89
3.5.7	Purification of polymers by breakdown of contaminants	91
3.6	Determination of physical properties of wall polymers	92
3.6.1	Determination of molecular weight (M_r)	92
3.6.2	Determination of charge	93
3.7	Assays for wall components	95
4	Wall polymers: chemical characterisation	102
4.1	Specific chemistry of known primary cell wall polymers	102
4.1.1	Classes of polysaccharide	102
4.1.2	Cellulose	102
4.1.3	Pectins	104
4.1.4	Hemicelluloses	109
4.1.5	Extensins	112
4.1.6	Arabinogalactan-proteins (AGPs)	114
4.1.7	Enzymic glycoproteins and lectins	115
4.1.8	Cutin, suberin, lignin and tannins	115
4.2	Analytical degradation of carbohydrate moieties	118
4.2.1	Acid-catalysed hydrolysis (complete)	119
4.2.2	Acid-catalysed hydrolysis (partial)	121
4.2.3	Acetolysis	124
4.2.4	Alkaline degradation	126

41	4.2.5	Enzymic hydrolysis	128
42	4.2.6	Borohydride reduction	133
43	4.2.7	Periodate oxidation	135
44	4.2.8	Methylation analysis	139
	4.2.9	Determination of optical isomerism of a monosaccharide	140
	4.3	Analytical degradation of glycoproteins	142
49	4.3.1	Splitting the sugar--amino acid bond	142
49	4.3.2	Splitting the polypeptide backbone	143
49	4.3.3	Analysis of the amino acids	145
52	4.4	Analytical degradation of wall phenolics	146
53	4.4.1	Alkaline hydrolysis of esters of phenolic acids	146
57	4.4.2	Feruloyl-oligosaccharides from feruloyl-polysaccharides	147
58	4.4.3	Analysis of lignin	151
58	4.4.5	Analysis of tannins	152
60	4.5	Separation and identification of degradation products	153
60	4.5.1	Removal of degradation reagents	153
64	4.5.2	Paper chromatography (PC)	154
64	4.5.3	Thin-layer chromatography (TLC)	168
64	4.5.4	Paper electrophoresis (PE)	173
64	4.5.5	Charcoal (carbon) chromatography	180
71	4.5.6	Gel-permeation chromatography (GPC)	180
73	4.5.7	High-pressure liquid chromatography (HPLC)	181
75	4.5.8	Gas chromatography (GC, GLC)	184
75	4.6	Sequential analytical methods	185
79			
83			
87	5	Wall biosynthesis	188
88	5.1	Background to wall biosynthesis	188
89	5.1.1	Subcellular site	188
91	5.1.2	Precursors and intermediates	189
92	5.1.3	Glycosyltransferases and polysaccharide synthases	193
92	5.1.4	Post-synthetic modification of polysaccharides	195
93	5.1.5	Secretion	195
95	5.1.6	Regulation of wall polysaccharide synthesis	196
	5.1.7	Biosynthesis of glycoproteins	197
	5.1.8	Diferulate, fignin, and related phenolics	198
102	5.2	In vivo assay of wall polysaccharide and glycoprotein synthesis	202
102	5.2.1	Rate of synthesis	202
102	5.2.2	Route of synthesis	202
102	5.3	In vivo analysis of intermediates in wall synthesis	205
104	5.3.1	Inositol	205
109	5.3.2	Sugar phosphates	205
112	5.3.3	NDP-sugars	208
114	5.3.4	Glycolipids involved in glycosyl-transfer	210
115	5.3.5	Analysis of aminoacyl-tRNAs	211
115	5.3.6	Hydroxycinnamoyl-CoA and -glucoside derivatives	212
118	5.4	Preparation of radioactive precursors of wall biosynthesis	213
119	5.4.1	Radioactive NDP-sugars	213
121	5.4.2	Radioactive ferulic acid & related compounds	214
124	5.5	In vitro assay of polysaccharide synthases in isolated membranes	216
126			

6	<u>Wall enzymes</u>	219
6.1	Occurrence and possible functions	219
6.1.1	Glycosidases	219
6.1.2	Endoglycanases	221
6.1.3	Transglycosylases	222
6.1.4	Other hydrolases	223
6.1.5	Peroxidases	224
6.1.6	Oxidases	224
6.1.7	Malate dehydrogenase (MDH)	225
6.2	Evidence for localisation of enzymes in the cell wall	226
6.2.1	Evidence from wall isolation	226
6.2.2	Application of non-permeant substrates to living cells	226
6.2.3	Evidence from isolation of protoplasts	227
6.3	Mode of wall-binding of enzymes	227
6.3.1	Evidence for freely soluble wall enzymes	227
6.3.2	Evidence for ionically-bound wall enzymes	227
6.3.3	Evidence for covalently-bound wall enzymes	229
6.4	Extraction and purification of wall enzymes	229
6.4.1	Extraction of freely-soluble wall enzymes	229
6.4.2	Extraction of ionically-bound wall enzymes	230
6.4.3	Extraction of covalently-bound wall enzymes	230
6.4.4	Purification of wall enzymes	231
6.5	Assay of wall enzymes	231
7	<u>Wall architecture</u>	238
7.1	Background	238
7.1.1	Significance of wall cross-links	238
7.1.2	Non-covalent cross-links	238
7.1.3	Covalent cross-links	239
7.2	Detection of non-covalent cross-links	242
7.3	Detection of covalent cross-links	243
7.3.1	Isolation of cross-links	244
7.3.2	Liberation of polymers by cleavage of cross-links	246
7.3.3	Blocking of wall-binding of newly-secreted polymer	247
7.3.4	Formation of cross-links <u>in vitro</u>	248
8	<u>Wall turnover and sloughing</u>	250
8.1	Occurrence and significance of wall turnover	250
8.2	Wall polymer sloughing	252
9	<u>Biologically-active wall oligosaccharides</u>	257
9.1	Background	257
9.1.1	Introduction	257
9.1.2	Fungal oligo- β -(1 $\rightarrow$ 3),(1 $\rightarrow$ 6)-glucans: elicitors	258
9.1.3	Oligogalacturonans: endogenous elicitors	259
9.1.4	Pectic fragments: activators of protein synthesis	259
9.1.5	Xyloglucan nonasaccharide (XG9): an anti-auxin	260

219	9.1.6	Unidentified wall fragments: hypersensitivity factors?	260
219	9.1.7	— : regulators of morphogenesis?	261
219	9.1.8	— : grafting compatibility factors?	261
221	9.2 Preparation of biologically-active wall oligosaccharides		262
222	9.2.1	Mild acid-hydrolysis	262
223	9.2.2	Enzymic hydrolysis	262
224	9.3 Bioassay of biologically-active oligosaccharides		264
224			
225	9.4 Fate of oligosaccharides <u>in vivo</u>		266
226	9.4.1	Transport	266
226	9.4.2	Binding	266
226	9.4.3	Degradation	266
227	9.5 Natural occurrence of biologically-active oligosaccharides		267
227			
227	10 <u>Wall tightening and loosening: growth</u>		269
229	10.1 Background		269
229	10.1.1	The biophysical basis of cell growth	269
229	10.1.2	Physiological mode of action of growth hormones	270
230	10.1.3	Chemical basis of wall loosening	272
230	10.1.4	Chemical basis of wall tightening	274
231	10.1.5	Special rôle of the epidermis	276
231	10.2 Experimental approach to study of wall tightening and loosening		276
	10.2.1	Important unanswered questions	276
	10.2.2	Choice of plant material	277
238	10.2.3	Analytical techniques	277
238			
238	11 <u>Wall degradation</u>		279
239	11.1 Background		279
242	11.1.1	Biologically important situations	279
243	11.1.2	Economically important situations	279
244	11.1.3	Information from digestibility about wall architecture	280
246	11.2 Attacking the plant cell wall		280
247	11.3 Defending the plant cell wall		281
248	11.3.1	Enzyme-proofing agents	282
	11.3.2	Cross-linking of structural polymers	282
	11.3.3	Production of enzyme inhibitors	283
250	11.4 The counter-attack		283
250	11.4.1	Enzymic degradation of the lignin	283
252	11.4.2	Prevention of lignin formation	284
	11.4.3	Chemical de-lignification	284
	11.4.4	Chemical degradation of the polysaccharides	284
257	11.5 Methods		284
257			
257	<u>Further reading</u>		286
258			
259	<u>References</u>		287
259			
260	<u>Index</u>		323
