Series Preface	v
Preface	vii
Translator's Preface	xi
I Composite Materials	1
1 Basic Features of Composite Materials	3
1.1 Composite Materials	3
1.1.1 Definition	3
1.1.2 General Characteristics	3
1.2 Classification of Composite Materials	5
1.2.1 Classification by the Form of Constituents	5
1.2.2 Classification by the Nature of Constituents	6
1.3 Why Composite Materials?	7
1.3.1 Specific Mechanical Characteristics	7
1.3.2 Mechanical Characteristics of Materials	9
1.3.3 Composite Materials	10
1.4 Volume and Weight Fractions	11
1.4.1 Introduction	11
1.4.2 Volume Fractions	11
1.4.3 Weight Fractions	11

1.4.4	Relations between Volume and Weight Fractions	12
1.4.5	Presence of Porosity	13
Exercises		14
2	The Constituents of a Composite Material	15
2.1	Introduction	15
2.2	Resin Systems	15
2.2.1	The Various Types of Resins	15
2.2.2	Thermosetting Resins	16
2.2.3	Thermoplastic Resins	19
2.2.4	Thermostable Resins	20
2.3	Fillers and Additives	21
2.3.1	Introduction	21
2.3.2	Fillers	21
2.3.3	Additives	23
2.4	Fiber and Cloth Reinforcements	24
2.4.1	Basics	24
2.4.2	Fiber Forms	25
2.4.3	Surface Tissues	25
2.4.4	Multidirectional Woven Structures	28
2.5	Different Fibers	29
2.5.1	Glass Fibers	29
2.5.2	Carbon Fibers	42
2.5.3	Aramid Fibers with High Mechanical Properties	47
2.5.4	Ceramic Fibers	49
2.5.5	Thermostable Synthetic Fibers	50
2.5.6	Other Fibers	52
3	Molding Processes and Architecture of Composite Materials	54
3.1	Introduction	54
3.2	Molding Processes	54
3.2.1	Contact Molding	54
3.2.2	Vacuum Molding	57
3.2.3	Compression Molding	57
3.2.4	Continuous Molding	60
3.2.5	Pultrusion Molding	61
3.2.6	Centrifugal Molding	62
3.2.7	Filament Winding	63
3.3	Use of Prepregs and Compounds	66
3.3.1	Introduction	66
3.3.2	Prepregs	66
3.3.3	Molding Compounds	68
3.4	Architecture of Composite Materials	71
3.4.1	Introduction	71
3.4.2	Laminates	71

3.4.3	Sandwich Composites	79
3.4.4	Other Architectures	80
3.4.5	Consequences of the Study of the Mechanical Behavior of Composite Materials	81

II Basic Concepts of the Mechanical Behavior of Materials 83

4	Mathematical Basics	85
4.1	Transformation of Coordinate Systems	85
4.1.1	General Expression	85
4.1.2	Rotation about an Axis	87
4.2	Second-Order Tensors	88
4.2.1	Introduction	88
4.2.2	Change of Reference System	88
4.2.3	Diagonalization of a Matrix: Eigenvectors and Eigenvalues	89
4.2.4	Inversion of a Symmetric Matrix of Order Three	90
5	Stresses	91
5.1	Stress State in a Solid	91
5.1.1	Stress Tensor	91
5.1.2	Force Acting at a Point on a Surface Element	91
5.2	Properties of the Stress Tensor	93
5.2.1	Physical Interpretation of the Stress Components	93
5.2.2	Normal and Tangential Components of the Stress Vector	95
5.2.3	Principal Directions, Principal Stresses	96
5.2.4	Change of Reference System	96
5.3	Particular States of Stresses	97
5.3.1	Spherical Tensor and Stress Deviator	97
5.3.2	Spherical Compression or Tension	98
5.3.3	Uniaxial Tension or Compression State	98
5.3.4	Shear State	99
5.3.5	State of Plane Stress	101
5.3.6	Arbitrary Stress State	102
5.4	Engineering Matrix Notation	102
5.4.1	Introduction of the Notation	102
5.4.2	Change of Reference System	103
	Exercises	104
6	Strains	105
6.1	The Strain Tensor	105
6.1.1	Strains at a Point	105

6.1.2	Strain Tensor	107
6.1.3	Interpretation of the Strain Components	108
6.1.4	Compatibility Conditions	110
6.2	Strain State at a Point	111
6.2.1	Elongation per Unit Length	111
6.2.2	Shear Strain	112
6.2.3	Strain Tensor in the Principal Directions	113
6.2.4	Change of Reference System	114
6.3	Particular States of Strains	115
6.3.1	Spherical Tensor and Strain Deviator	115
6.3.2	Particular States	115
6.4	Engineering Matrix Notation	116
6.4.1	Introduction of the Notation	116
6.4.2	Change of Reference System	116
	Exercises	117
7	The Elastic Behavior of Materials	121
7.1	Stress–Strain Relations for Anisotropic Materials	121
7.1.1	Introduction	121
7.1.2	Stiffness Matrix	121
7.1.3	Compliance Matrix	122
7.1.4	Change of Reference System	122
7.1.5	Anisotropic Materials	123
7.2	Isotropic Materials	125
7.2.1	Elasticity Relations	125
7.2.2	Moduli of Elasticity	127
7.2.3	Relations between the Coefficients of Elasticity	129
7.2.4	Expressions for the Stiffness and Compliance Matrices	129
	Exercises	130
8	The Mechanics of Deformable Solids	131
8.1	Fundamental Equations of Motion	131
8.2	Formulation of the Structural Analysis	133
8.2.1	Statement of the Problem	133
8.2.2	Equations in Cartesian Coordinates	136
8.2.3	Equations in Cylindrical Coordinates	138
8.3	Energy Formulation	139
8.3.1	Variation of a Functional	139
8.3.2	The Virtual Work Theorem	140
8.3.3	Dynamics of Solids	143
8.4	Variational Methods	144
8.4.1	The Principle	144
8.4.2	Convergence	145
	Exercises	146

III Mechanical Behavior of Composite Materials 147

9 Elastic Behavior of Unidirectional Composite Materials 149

9.1	Effective Moduli	149
9.1.1	The Concept of Homogenization	149
9.1.2	Homogenized Moduli	150
9.2	Hooke's Law for a Unidirectional Composite	151
9.2.1	Constitution of a Unidirectional Composite Material	151
9.2.2	Stiffness and Compliance Matrices	152
9.3	Engineering Constants	153
9.3.1	Longitudinal Tensile Test	153
9.3.2	Transverse Tensile Test	154
9.3.3	Longitudinal Shear Test	155
9.3.4	Transverse Shear Test	156
9.3.5	Lateral Hydrostatic Compression	156
9.3.6	Moduli as Functions of the Stiffness and Compliance Constants	157
9.3.7	The Stiffness and Compliance Constants as Functions of the Engineering Constants	159
9.3.8	Restrictions on the Engineering Constants	160
9.4	Theoretical Approaches to Evaluating Engineering Constants	160
9.4.1	Different Approaches to the Problem	160
9.4.2	Bounds on the Engineering Constants	162
9.4.3	Exact Solutions	164
9.4.4	Simplified Approaches	171
9.4.5	Halpin-Tsai Equations	178
9.5	Numerical Values of the Engineering Constants	179
9.5.1	Experimental Values of Moduli	179
9.5.2	Comparison of Experimental and Calculated Values of Moduli	181
9.5.3	Conclusions	182
	Exercises	185

10 Elastic Behavior of an Orthotropic Composite 186

10.1	Hooke's Law for an Orthotropic Composite	186
10.1.1	Orthotropic Composite	186
10.1.2	Stiffness and Compliance Matrices	187
10.2	Engineering Constants	188
10.2.1	Tensile Test in the Warp Direction	188
10.2.2	Tensile Test in the Weft Direction	189
10.2.3	Transverse Tensile Test	189
10.2.4	Relation between Young's Moduli and Poisson Ratios	190
10.2.5	Shear Tests	190
10.2.6	Conclusion	191

10.3 Stiffness and Compliance Constants as Functions of the Engineering Constants	191
10.3.1 Compliance Constants	191
10.3.2 Stiffness Constants	192
10.3.3 Restriction upon the Elasticity Constants	192
Exercises	193
11 Off-Axis Behavior of Composite Materials	195
11.1 Stress–Strain Relations for Off-Axis Layers	195
11.1.1 Introduction	195
11.1.2 Stiffness and Compliance Matrices	196
11.1.3 Other Expressions for Stiffness Matrices	201
11.2 Engineering Constants	202
11.2.1 Expressions for Off-Axis Moduli	202
11.2.2 Variations in the Moduli of Elasticity of a Unidirectional Composite	207
11.3 Plane Stress State	208
11.3.1 Introduction	208
11.3.2 Two-Dimensional Stress State	212
11.3.3 Elasticity Equations for Plane Stress State	212
11.3.4 Reduced Stiffness Matrix in Principal Directions	215
11.3.5 Relations between the Off-Axis and Principal Axes Reduced Stiffness Constants	217
11.3.6 Conclusions	218
11.3.7 Example	219
11.4 Experimental Determination of Engineering Constants	222
11.4.1 Introduction	222
11.4.2 Longitudinal Tensile Test	222
11.4.3 Transverse Tensile Test	223
11.4.4 Off-Axis Tension	224
11.4.5 Specimens for Tensile Tests	225
Exercises	226
12 Fracture Mechanisms and Damage of Composite Materials	228
12.1 Fracture Processes Induced in Composite Materials	228
12.1.1 Introduction	228
12.1.2 Fracture Mechanisms Induced in a Unidirectional Composite Material	228
12.1.3 Unidirectional Composite Subjected to Longitudinal Tension	231
12.1.4 Fracture of Unidirectional Composite under Transverse Tensile Loading	235
12.1.5 Laminate Fracture Modes	236
12.1.6 Observation of Fracture Mechanisms	238

12.2 Failure Criteria	245
12.2.1 Introduction	245
12.2.2 Maximum Stress Criterion	246
12.2.3 Maximum Strain Criterion	251
12.2.4 Interactive Criteria	255
Exercises	263

IV Modeling the Mechanical Behavior of Laminates and Sandwich Plates 265

13 Basics of Laminate Theory	267
13.1 Introduction	267
13.1.1 Architecture	267
13.1.2 Notations and Objective	267
13.2 Displacement Field	269
13.2.1 General Expressions	269
13.2.2 Deformation of a Normal	269
13.2.3 First-Order Theory	270
13.3 Strain Field	272
13.3.1 General Expressions	272
13.3.2 First-Order Theory	273
13.4 Stress Field	273
13.4.1 General Expression	273
13.4.2 Simplification in the Context of the Theory of Plates	274
13.5 Resultants and Moments	275
13.5.1 In-Plane Resultants	275
13.5.2 Transverse Shear Resultants	277
13.5.3 Resultant Moments	277
13.6 Fundamental Equations for Plates in a First-Order Theory	278
13.6.1 Fundamental Equations of the Mechanics of Materials	278
13.6.2 Fundamental Equations for In-Plane Resultants	279
13.6.3 Fundamental Equation for Transverse Shear Resultants	280
13.6.4 Fundamental Equations of Moments	281
13.6.5 Summary of Fundamental Equations	283
13.6.6 Statics Problems	285
Exercises	286

14 Classical Laminate Theory	287
14.1 Strain Field	287
14.1.1 Assumptions of the Classical Theory of Laminates	287
14.1.2 Expression for the Strain Field	288
14.2 Stress Field	291
14.2.1 Form of the Stress Field	291
14.2.2 Stress Expression	291

14.3	Resultant and Moment Expressions	292
14.3.1	In-Plane Resultants	292
14.3.2	Resultant Moments	293
14.4	Mechanical Behavior Equation of a Laminate	294
14.4.1	Constitutive Equation	294
14.4.2	Stiffness Matrix	295
14.4.3	Examples	295
14.5	Determination of Strains and Stresses	301
14.5.1	The Problem to Be Solved	301
14.5.2	In-Plane Strains and Curvatures	302
14.5.3	Strain Field	303
14.5.4	Stress Field	304
14.5.5	Example	304
	Exercises	310
15	Effect of the Stacking Sequence. Mat and Cloth Reinforced Materials	312
15.1	Effect of the Stacking Sequence	312
15.1.1	Case of One Layer	312
15.1.2	Symmetric Laminates	316
15.1.3	Antisymmetric Laminates	318
15.1.4	Cross-Ply Laminates	319
15.1.5	Angle-Ply Laminates	325
15.1.6	Laminates with Isotropic Layers	328
15.1.7	Arbitrary Laminates	329
15.2	Evaluation of the Engineering Constants of Mat and Cloth Reinforced Materials	330
15.2.1	Introduction	330
15.2.2	Characterization of a Cloth Reinforcement	330
15.2.3	Laminate Analogy	334
15.2.4	In-Plane Behavior of a Cloth Reinforced Layer	336
15.2.5	In-Plane Moduli of a Cloth Reinforced Layer	337
15.2.6	Numerical Applications	339
15.2.7	Mat Reinforced Layer	340
15.2.8	Laminate with Mat and Cloth Reinforced Layers	342
	Exercises	345
16	Governing Equations and Energy Formulation of the Classical Laminate Theory	346
16.1	Governing Equations	346
16.1.1	General Relations	346
16.1.2	Symmetric Laminates	347
16.1.3	Antisymmetric Cross-Ply Laminates	348
16.1.4	Expressions for Resultants and Moments	349
16.1.5	Expression for Stresses	350

16.2	Boundary Conditions	351
16.2.1	Basics	351
16.2.2	Simply Supported Edge	352
16.2.3	Clamped Edge	352
16.2.4	Free Edge	353
16.3	Energy Formulation of Laminate Theory	354
16.3.1	Introduction	354
16.3.2	Strain Energy of a Laminate	354
16.3.3	Kinetic Energy of a Laminate	356
16.3.4	Energy of External Loads	357
17	Including Transverse Shear Deformation in Laminate Theory	358
17.1	Limitations of the Classical Laminate Theory	358
17.2	Strain and Stress Fields	358
17.2.1	Displacement Field	358
17.2.2	Strain Field	359
17.2.3	Stress Field	362
17.3	Fundamental Equations of Laminates, Including Transverse Shear Deformation	363
17.3.1	Constitutive Equation	363
17.3.2	Fundamental Equations	365
17.3.3	Boundary Conditions	367
17.3.4	Stresses in the Layers	367
17.4	Introduction of Shear Coefficients	369
17.4.1	Assumptions of Laminate Theory	369
17.4.2	Evaluation of Shear Correction Factors in the Case of Orthotropic Plates	371
17.4.3	Evaluation of Shear Correction Factors in the Case of a Laminated Plate	373
17.5	Conclusions	379
	Exercises	380
18	Theory of Sandwich Plates	382
18.1	Introduction	382
18.2	Strain and Stress Fields	383
18.2.1	Assumptions for Sandwich Theory	383
18.2.2	Displacement Field	383
18.2.3	Strain Field	384
18.2.4	Stress Field	385
18.3	Governing Equations of Sandwich Plates	386
18.3.1	Constitutive Equation	386
18.3.2	Fundamental Equations	388
18.4	Sandwich Materials with Thick Skins	389
	Exercises	391

V Analysis of the Mechanical Behavior of Composite Material Structures	393
19 Cylindrical Bending	395
19.1 Introduction	395
19.2 Classical Laminate Theory	395
19.2.1 Equations	395
19.2.2 Uniform Load	397
19.2.3 Sinusoidal Load	401
19.3 Including the Transverse Shear Effect	401
19.3.1 Orthotropic Laminate	401
19.3.2 Angle-Ply Laminate	404
19.4 Exact Solution	406
19.5 Comparison between the Different Theories	410
19.5.1 $[0^\circ/90^\circ]$ Laminate	410
19.5.2 $[0^\circ/90^\circ/0^\circ]$ Laminate	412
19.6 Cylindrical Bending of Sandwich Plates	412
20 Bending of Laminate and Sandwich Beams	419
20.1 Introduction	419
20.2 Classical Laminate Theory	420
20.2.1 General Expressions	420
20.2.2 Three-Point Bending	424
20.2.3 Four-Point Bending	427
20.3 Including the Transverse Shear Deformation	431
20.3.1 General Equations	431
20.3.2 Three-Point Bending	434
20.3.3 Four-Point Bending	438
20.4 Bending of Sandwich Beams	440
20.4.1 General Expressions	440
20.4.2 Comparison between Sandwich Theory and Laminate Theory with Transverse Shear	443
Exercises	449
21 Bending of Orthotropic Laminate Plates	450
21.1 Introduction	450
21.2 Simply Supported Rectangular Plates	451
21.2.1 General Expressions	451
21.2.2 Case of Uniform Load	453
21.2.3 Case of Load Distributed over a Rectangle	460
21.3 Rectangular Plates with Two Simply Supported Edges	461
21.3.1 Case of an Arbitrary Load	461
21.3.2 Case of Uniform Loading	464
21.4 Rectangular Plates with Various Boundary Conditions	466
21.5 Clamped Rectangular Plates	470

21.5.1	Introduction	470
21.5.2	Solution Approximated by Polynomial Functions	470
21.5.3	Solution Approximated by Beam Functions	472
21.5.4	Comparison between the Approximate Solutions	475
21.6	Simply Supported Sandwich Plates	479
	Exercises	483
22	Bending of Plates Made of Symmetric, Cross-Ply, or Angle-Ply Laminates	486
22.1	Symmetric Laminate Plates	486
22.1.1	General Expressions	486
22.1.2	Simply Supported Symmetric Laminate Plates	488
22.1.3	Clamped Symmetric Laminate Plates	489
22.2	Rectangular Cross-Ply Plates	491
22.2.1	General Expressions	491
22.2.2	Influence of the Moduli	494
22.2.3	Influence of the Length-to-Width Ratio	496
22.3	Rectangular Angle-Ply Plates	498
	Exercises	502
23	Buckling of Laminate or Sandwich Beams and Plates	504
23.1	Governing Equations Including Buckling	504
23.1.1	Introduction	504
23.1.2	Plate Equations Taking Account of Buckling	505
23.1.3	Equations of the Classical Laminate Theory Taking Account of Transverse Displacement	508
23.1.4	Energy Formulation of Buckling	511
23.1.5	Equations of Transverse Shear Theory Taking Account of Transverse Displacement	512
23.1.6	Equations of Sandwich Theory Taking Account of Transverse Displacement	512
23.2	Buckling under Cylindrical Bending	513
23.2.1	Classical Laminate Theory	513
23.2.2	Effect of Transverse Shear	515
23.2.3	Buckling of a Sandwich Plate	517
23.3	Buckling of Beams	518
23.3.1	Buckling Equation	518
23.3.2	Simply Supported Beam	519
23.3.3	Clamped Beam	520
23.3.4	Other Support Conditions	521
23.3.5	Effect of Transverse Shear	522
23.3.6	Buckling of a Sandwich Beam	523
23.4	Buckling of Orthotropic Plates under Biaxial Compression	523
23.4.1	General Expressions	523
23.4.2	Uniaxial Compression	525

23.4.3	Square Plate under Biaxial Compression	526
23.5	Buckling of Orthotropic Plates under Arbitrary Conditions . . .	528
23.5.1	General Expressions	528
23.5.2	Clamped Orthotropic Plates Subjected to Uniform Shear	529
	Exercises	532
24	Vibrations of Laminate or Sandwich Beams and Plates	534
24.1	Introduction	534
24.2	Cylindrical Bending	535
24.2.1	Classical Laminate Theory	535
24.2.2	Effect of Transverse Shear	538
24.2.3	Vibrations of Sandwich Plates	540
24.3	Free Vibrations of Beams	541
24.3.1	General Equation	541
24.3.2	Simply Supported Beam	541
24.3.3	Clamped Beam	542
24.3.4	Beam Clamped at One End and Simply Supported at the Other	544
24.3.5	Beam Clamped at One End and Free at the Other	545
24.3.6	Beam with Two Free Ends	547
24.4	Vibrations of Simply Supported Rectangular Orthotropic Plates .	549
24.5	Vibrations of Orthotropic Plates with Various Conditions along the Edges	554
24.5.1	General Expressions	554
24.5.2	Rayleigh's Approximation	555
24.5.3	Two-Term Approximation	556
24.5.4	Orthotropic Plate with Simply Supported or Clamped Edges	557
24.6	Vibrations of Symmetric Laminate Plates	562
24.6.1	General Expressions	562
24.6.2	Symmetric Plate with Clamped or Free Edges	562
24.7	Vibrations of Nonsymmetric Laminate Plates	566
24.7.1	Plate Made of an Antisymmetric Cross-Ply Laminate . .	566
24.7.2	Plate Made of an Angle-Ply Laminate	569
	Exercises	571
25	Expansional Strain Effects on Laminate Mechanical Behavior	574
25.1	Introduction	574
25.2	Elasticity Relations Including Expansional Strain Effects . . .	574
25.2.1	Elasticity Relations in Principal Directions	574
25.2.2	Off-Axis Elasticity Relations	577
25.3	Governing Equations	578
25.3.1	Constitutive Equation	578
25.3.2	Examples	580

25.3.3	Fundamental Relations	586
25.3.4	Strain Energy	588
25.4	Behavior of Rectangular Plates	589
25.4.1	Rectangular Plate Made of a Symmetric Laminate	589
25.4.2	Rectangular Plate Made of an Angle-Ply Antisymmetric Laminate	591
25.4.3	Thermal Effects	593
	Exercises	596
26	Predesigning Laminate and Sandwich Structures	598
26.1	Problem of Designing	598
26.2	Basic Elements of Composite Structures	599
26.2.1	Simple Beams	599
26.2.2	Profiles	603
26.2.3	Sandwich Beams	605
26.2.4	Plates	607
26.3	Evaluation of the Engineering Constants	607
26.3.1	Moduli	607
26.3.2	Fracture Characteristics	608
26.4	Structural Analysis by the Finite Element Method	610
26.4.1	Introduction	610
26.4.2	Finite Element Method	612
26.4.3	Validation	614
26.5	Examples of Predesigning	614
26.5.1	Predesigning the Hull of a Yacht	614
26.5.2	Predesigning the Hood of a Car	620
A	Clamped-Clamped Polynomial Function	629
B	Characteristic Function of a Beam with Clamped Ends	633
	References	637
	Index	641
