

Table of Contents

Preface	xv
Acknowledgements	xix
About the Cover	xx
Chapter 1. Introduction	1
1.0. Brownian Motion	1
1.1. Brief History of Dynamic Light Scattering	2
1.2. Time Scales	3
1.3. Organization of the Textbook	5
1.4. Nomenclature	8
Chapter 2. Basic Concepts of Light Scattering	11
2.0. Introduction	11
Part I. Interaction of Light with Matter	12
2.1. The Nature of Light	12
2.2. The Electrical Nature of Matter	12
2.3. The Scattered Electric Field	13
2.4. Fluctuations in the Polarizability	15
Part II. Total Intensity Light Scattering	16
2.5. Total (Integrated) Intensity of Scattered Light	16
2.6. Light Scattering by Small, Noninteracting Particles	20
2.7. Light Scattering by Large, Noninteracting Particles	21
2.8. Light Scattering by Small, Interacting Particles	25
2.9. Light Scattering by Large, Interacting Particles: One-Contact Approximation	26

2.10. Solution Structure Factor	28
Part III. Dynamic Light Scattering	31
2.11. Time-Dependent Total Intensity	31
2.12. Electric Field and Intensity Correlation Functions	31
2.13. Center-of-Mass Diffusion	32
2.14. Effect of ratio C_p/K^3 on D_m	33
2.15. Osmotic Susceptibility Correction	34
2.16. Dynamic Light Scattering by Absorbing Molecules	35
2.17. Evaluation of $\langle \Delta C_p(\mathbf{K}, 0) * \Delta C_p(\mathbf{K}, 0) \rangle$	37
Summary	38
Problems	38
Additional Reading	42
Chapter 3. Translational Diffusion—Hydrodynamic Dissipation	43
3.0. Introduction	43
3.1. Macroscopic Description of Mass Transport	43
3.2. D_m and the Osmotic Susceptibility	45
3.3. Effect of External Field—Sedimentation	46
3.4. Friction Factors Associated with D_{Tr} and D_m	47
3.5. Determination of the Molecular Weight	49
3.6. Determination of the Equivalent Hydrodynamic Shape of Regular Solids	50
3.7. Determination of the Equivalent Hydrodynamic Shape of Irregular Rigid Structures	52
3.8. Anisotropic Translational Diffusion of Cylinders	55
3.9. Diffusion of Random-Flight, Linear Molecules	57
3.10. Diffusion of Linear Polymers under Theta Conditions	58
3.11. Excluded Volume—the Flory Limit	61
3.12. Excluded Volume Effect on Translational Diffusion of Linear Molecules	62
3.13. Flexible Circular Molecules	65
3.14. Flexible Branched Molecules and Stars	66
3.15. Crossover Exponential, Phase Separation, and Chain Dimensionality	69
Summary	72
Problems	72
Additional Reading	76
Chapter 4. Multiple Decay Analysis of the Correlation Function	77
4.0. Introduction	77
4.1. Effect of Polydispersity on the Scattering Amplitudes	77
4.2. Single/Double Exponential Analysis	79
4.3. Cumulant Analysis	79

4.4. Asymptotic Analysis Method	81
4.5. Expansion Methods Applied to Simulated Data	81
4.6. Lambda Depression Analysis	85
4.7. Z-Transform and Method of Spike Recovery	86
4.8. Linear Programming Method	87
4.9. Inverse Laplace Transform Methods—General Comments	88
4.10. Overlay Histogram Method with Exponential Sampling	91
4.11. CONTIN and DISCRETE	91
4.12. Effect of Noise on the Analysis of $C(K, t)$	92
4.13. Multiple Scattering—Diffusing Wave Spectroscopy	95
Summary	96
Problems	97
Additional Reading	98
 Chapter 5. Dilute to Congested Solutions of Rods and Flexible Coils	99
5.0. Introduction	99
5.1. The Autocorrelation Function	99
5.2. The Cylindrical Particle—General Development	100
5.3. Centrosymmetric Particles—the Rigid Rod for $KL < 1$	102
5.4. Centrosymmetric Particles—the Rigid Rod for $KL \gg 1$	105
5.5. Irregular-Shaped Particles with Cylindrical Symmetry	107
5.6. Semi-flexible Linear Polymers	109
5.7. The Continuum Model for Linear Polymers	110
5.8. The Discrete Model for Linear Polymers	114
5.9. The Correlation Function for Flexible Coils	116
5.10. Estimation of the Rouse–Zimm Parameters	122
5.11. Internal Modes for Circular DNA—the <i>Soda Model</i>	122
5.12. Effect of Hydrodynamic Interaction on $S(K, \omega)$	125
5.13. Intermediate K Region	126
5.14. Brownian Dynamics Calculations	128
5.15. Semidilute Solution Regime for Flexible Polymers: the Blob Model	129
5.16. Linear Polymers in Concentrated Solutions, Gels, and Melts: the Reptation Model	131
5.17. The Crossover Model for Congested Polymer Solutions	134
5.18. Universal Scaling Curves for the Correlation Lengths	140
5.19. Probe Diffusion in a Polymer Matrix	142
5.20. Stretched Exponential Representation of Polymer Solutions and Melts	145
5.21. Computer Simulation of Kolinski, Skolnick, and Yaris for Congested Solution Motion	147
5.22. Polymer Melts and the Glass Transition	147

5.23. Rigid and Semiflexible Rods in Congested Solutions	148
5.24. Computer Simulations of Congested Solutions of Rods	150
Summary	150
Problems	151
Additional Reading	155
Chapter 6. Hydrodynamic and Short-Range Interparticle Interactions	157
6.0. Introduction	157
6.1. The Generalized Langevin Equation	157
6.2. The Stokes Solvent Flow Field Due to an Isolated Sphere	158
6.3. The Stokes Friction Factor and Faxén's Theorem	163
6.4. Transmission of the Indirect Interaction	163
6.5. Time-Dependent Diffusion Coefficients	164
6.6. K -Dependence of the Initial Decay Rate of $G_1(K, t)$	167
6.7. Lowest-Order Correction to D_m for Identical Spheres: the Batchelor and the Anderson-Reed Models	170
6.8. Higher-Order Pairwise Interaction Terms: The Method of Reflections	177
6.9. Effect of Divergent Terms on D_m	180
6.10. Concentrated Solutions: The Method of Induced Forces	181
6.11. Evaluation of $\langle D_{\text{self}}^S \rangle$	184
6.12. Evaluation of $\langle D_{\text{self}}^L \rangle$	187
6.13. D_{self} and the Glass Transition for Hard Spheres	190
6.14. Are Hydrodynamic Interactions Screened?	194
6.15. Evaluation of $\langle D_{\text{app}}(K, \tau) \rangle$	195
6.16. Tertiary Solutions of Hard Spheres	195
6.17. Is Macavity There?	198
Summary	200
Problems	201
Chapter 7. Polyelectrolyte Solutions	205
7.0. Introduction	205
7.1. The Poisson-Boltzmann Equation and the Debye-Hückel Screening Length	205
7.2. Statistical Properties of Electrolyte Systems	207
7.3. Small Ion-Polyion Coupled Modes: General Framework	207
7.4. Small Ion-Polyion Coupled Modes: $K = 0$ Limit	210
7.5. $D_{\text{app}}(K)/D_{\text{app}}(K = 0)$ v. K for Weakly Coupled Polyelectrolytes	212
7.6. Inclusion of Hydrodynamic Interaction: The Belloni-Drifford Model for Polyelectrolyte Solutions	215
7.7. Dynamic Attenuation	217
7.8. Electrolyte Dissipation	218

7.9. Polyelectrolyte Dissipation	224
7.10. Counterion Condensation—the Manning Theory	225
7.11. Small-Ion Distribution about Charged Rods, Planes, and Spheres	229
7.12. The Electrostatic Contribution to the Persistence Length of Flexible Polyelectrolytes	231
7.13. Composite Diffusion Coefficient for Flexible Polyions in the Debye–Hückel Limit	239
7.14. Semidilute Régime for Polyelectrolytes: Scaling Laws	244
7.15. Effect of Small Ions on the Scattering Power of Polyelectrolytes	245
Summary	249
Problems	250
Chapter 8. Colloids	261
8.0. Introduction	261
8.1. The Electric Double Layer	264
8.2. The Stern Layer	264
8.3. The Gouy Region and the Debye–Hückel Region	265
8.4. General Features of the Problem of the Interaction between Charged Surfaces	267
8.5. The Double Layer above Spherical and Planar Surfaces	267
8.6. Classical DLVO: Repulsive Interaction between Spheres in the Asymptotic Limits of a_p/λ_{DH}	269
8.7. Classical DLVO: Hamaker Expression for the van der Waals– London Attractive Interaction	272
8.8. Properties of the Classical DLVO Potential	273
8.9. Applications of the DLVO Potential to Real Systems	273
8.10. Analytical Expression for $S(K \Delta R)$ for the Hard Sphere Potential in the Percus–Yevick Approximation	279
8.11. Beyond the Classical DLVO Potential	279
8.12. Diffusion in Structured Colloidal Suspensions	285
8.13. Fractal Objects	289
8.14. “How Long Is the Coast of Britain?”	291
8.15. Diffusion versus Activation Control in Bimolecular Solution Kinetics	292
8.16. Equilibrium and Kinetics Distribution of Cluster Sizes for Diffusion-Limited Aggregation	293
8.17. Time Evolution of the Number of Clusters for Irreversible Aggregation	297
8.18. Static Scattering Properties of Colloidal Aggregates	299
8.19. Dynamic Light Scattering by Colloidal Aggregates	302
8.20. Orientation Constraints on DLA Kinetics	307

8.21. Computer Simulation of Colloidal Aggregation	309
Summary	312
Problems	312
Additional Reading	317
Chapter 9. External Perturbations	319
9.0. Introduction	319
9.1. General Mathematical Framework	319
9.2. The Zeta Potential	321
9.3. Electrophoretic Mobility and the Zeta Potential	321
9.4. The Effect of Nonuniform Distribution and Electric Field Strength-Dependent Zeta Potentials	327
9.5. Application of a Constant Electric Field: Doppler Shift Spectroscopy (DSS)	335
9.6. Application of a Periodic Pulsed Electric Field—PPEF	344
9.7. Application of a Sinusoidal Electric Field—QELS-SEF	348
9.8. Frequency and Field Strength Dependent D_p^{sef} and μ_p	351
9.9. Sinusoidal Enhancement of Correlated Structures—SECS	353
9.10. A Comparison of DSS, PPEF, and QELS-SEF Techniques	354
9.11. Hydrodynamic Fields: Constant and Oscillatory Solvent Flow	357
9.12. Mechanical Excitation of Gels	362
9.13. Diffusion under High-Pressure Conditions	364
9.14. Reaction Kinetics	366
Summary	371
Problems	372
Chapter 10. Dynamic Light Scattering from Complex Media	377
10.0. Introduction	377
10.1. Splitting of Relaxation Modes for DNA Fragments as a Function of Ionic Strength	377
10.2. Splitting of Relaxation Modes of Highly Polymerized DNA	380
10.3. "Ordering" in Polyelectrolyte Solutions	383
10.4. The Ordinary-Extraordinary Transition— <i>Jeu du Molécules Somnolentes</i>	390
Additional Reading	396
Appendix A. Mathematical Notation	397
Appendix B. Structure Factors for Multicomponent Systems	399
Appendix C. The Ornstein-Zernike Relation and the Pair Distribution Function	405

TABLE OF CONTENTS

xiii

Appendix D. MSA and RMSA Solution to the Ornstein-Zernike Relationship	411
Appendix E. The Medina-Noyola Formalism for the Tracer Friction Factor	417
Glossary	423
Bibliography	429
Index	445
