### Keynote address

|                                                                                 |   |
|---------------------------------------------------------------------------------|---|
| Computational convective and conductive heat transfer<br><i>B. Sundén</i> ..... | 3 |
|---------------------------------------------------------------------------------|---|

### Section 1: Diffusion-Convection

|                                                                                                                                                                      |    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Numerical simulation of flow and thermo-kinetics during the<br>autoclave-assisted cure of thick laminated composites<br><i>V.A.F. Costa &amp; A.C.M. Sousa</i> ..... | 21 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                                          |    |
|--------------------------------------------------------------------------------------------------------------------------|----|
| Unstable thermocapillary flow inside a $\text{NaNO}_3$ float zone<br><i>C.T. Nguyen, H. Bazzi &amp; N. Galanis</i> ..... | 31 |
|--------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                                                                                                        |    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| The influence of the solid inclusions on the heat transport in the<br>precrySTALLIZATION-zone<br><i>A.M. Balint, M.M. Mihailovici, D.G. Băllean, A. Neculae &amp; St. Balint</i> ..... | 43 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                                                    |    |
|------------------------------------------------------------------------------------------------------------------------------------|----|
| Mass and heat transfer in connection with the storage of hydrogen<br>in metal hydrides<br><i>O. Schmidtke &amp; J. Hapke</i> ..... | 53 |
|------------------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                  |    |
|--------------------------------------------------------------------------------------------------|----|
| Ventilation model for integration into DEROB<br><i>F. Arumí-Noé &amp; A. Praditsmanont</i> ..... | 63 |
|--------------------------------------------------------------------------------------------------|----|

|                                                                                                                                                                                     |    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Oscillatory double diffusive convection similarity between parallel and<br>cross temperature and solutal gradients<br><i>R. Bennacer, D. Akrou, H. Beji &amp; M. Betrouni</i> ..... | 73 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|

### Section 2: Conduction including non-linear problems

|                                                                                                                                                       |    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Thermo-elastic contact and heat transfer between plates and shells<br>through the heat-conducting layer<br><i>V.V. Zozulya &amp; M. Aguilar</i> ..... | 85 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                                                 |    |
|---------------------------------------------------------------------------------------------------------------------------------|----|
| A numerical model of heat transfer in a system<br>'plate casting-mold-surroundings'<br><i>F. Kavicka &amp; J. Stetina</i> ..... | 95 |
|---------------------------------------------------------------------------------------------------------------------------------|----|

|                                                                                                                  |     |
|------------------------------------------------------------------------------------------------------------------|-----|
| Non-linear convective phenomena under the film vapour condensation<br><i>A.M. Brener &amp; L. Tashimov</i> ..... | 105 |
|------------------------------------------------------------------------------------------------------------------|-----|

### Section 3: Natural and forced convection

|                                                                                                                                                 |     |
|-------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Contact-free generated forced convection through heat field rotation<br><i>A.E. Kokh, V.N. Popov, P.W. Mokrushnikov &amp; O. Ipatyeva</i> ..... | 117 |
|-------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                                   |     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Modeling of the conjugate heat transfer from a window adjacent<br>to a louvered shade<br><i>J. Phillips, D. Naylor, P.H. Oosthuizen &amp; S.J. Harrison</i> ..... | 127 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                               |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Three dimensional numerical simulation of thermal convection<br>in a Czochralski melt<br><i>D. Vizman, J. Freidrich &amp; G. Müller</i> ..... | 137 |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                                                        |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Numerical simulation of turbulent natural convection in a<br>vertical channel asymmetrically heated with constant heat flux<br><i>R. Bennacer, T. Hammami &amp; A.A. Mohamad</i> ..... | 147 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

### Section 4: Thermal radiation

|                                                                                                                                                      |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| A novel first-order scheme for numerical two-dimensional<br>radiative transfer analysis<br><i>D.R. Rousse, G. Gautier &amp; J.-F. Sacadura</i> ..... | 161 |
|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                                                                                |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Finite element formulation of the discrete ordinates method for coupled<br>conductive and radiative heat transfer in bidimensional complex geometries<br><i>C. Lopez, J.V. Daurelle &amp; R. Occelli</i> ..... | 171 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                   |     |
|-----------------------------------------------------------------------------------|-----|
| Calculation of mirror form factors value<br><i>K. Domke &amp; J. Hauser</i> ..... | 181 |
|-----------------------------------------------------------------------------------|-----|

### Section 5: Fire and combustion simulation

|                                                                                                      |     |
|------------------------------------------------------------------------------------------------------|-----|
| A severe buoyancy problem analysis and solution using CFD<br><i>M. Egoavil &amp; R. Puster</i> ..... | 193 |
|------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                     |     |
|---------------------------------------------------------------------------------------------------------------------|-----|
| Numerical analysis of radiation heat transfer in combustion of bio fuels<br><i>T. Nilsson &amp; B. Sundén</i> ..... | 203 |
|---------------------------------------------------------------------------------------------------------------------|-----|

## Section 6: Phase change

|                                                                                                                                                                                                                                  |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Numerical solution of Stefan problems in annuli<br><i>J. Caldwell &amp; C.C. Chan</i> .....                                                                                                                                      | 215 |
| Ice melting driven by natural convection in the vicinity of the density maximum<br><i>G. Vieira, S.L. Braga &amp; D. Gobin</i> .....                                                                                             | 227 |
| Influence of turbulent natural convection in simulating crystallization of II-VI semiconductors<br><i>P. Jelínek, R. Černý &amp; P. Přikryl</i> .....                                                                            | 237 |
| Dynamic leak increase in a steel wall caused by corium discharge<br><i>R. Wittmaack</i> .....                                                                                                                                    | 247 |
| Criticism of the classical mass balance for multiphase flow<br><i>F.J. Collado</i> .....                                                                                                                                         | 257 |
| On some factors having an effect on heat exchange and stability of the process of automated pulling from melt of alkali halide crystals<br><i>B.G. Zaslavsky, O.D. Kolotiy, I.I. Kisyl, V.S. Suzdal &amp; V.V. Lyakhov</i> ..... | 267 |
| The effect of aspect ratio on the development of convective motion in a bottom heated enclosure containing ice and water<br><i>P.H. Oosthuizen &amp; J.T. Paul</i> .....                                                         | 277 |

## Section 7: Thermal problems in porous media fibres and composites

|                                                                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Convection heat transfer of power-law fluids past a wedge embedded in a porous medium<br><i>Y.J. Kim</i> .....                                                                                   | 289 |
| Thermal properties evaluation with a transient method in powder melts and model describing different physico-chemical phenomena comparison<br><i>F. Baillet, H. Sallee &amp; P. Labeau</i> ..... | 299 |

## Section 8: Metal casting, welding, forging and other processes

|                                                                                                                                             |     |
|---------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Numerical simulation of solidification in twin-belt caster<br><i>T. Ito, Y. Takata, H. Shirakawa, H. Hamaguchi &amp; A.C.M. Sousa</i> ..... | 311 |
|---------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                          |     |
|--------------------------------------------------------------------------------------------------------------------------|-----|
| Numerical simulation of droplets formation in GMAW welding<br><i>M. Szanto, I. Shai, I. Gilad &amp; T.P. Quinn</i> ..... | 321 |
|--------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                            |     |
|------------------------------------------------------------------------------------------------------------|-----|
| Simulation of welding processes based on micro models<br><i>D. Weiss, A. Mahrle &amp; J. Schmidt</i> ..... | 331 |
|------------------------------------------------------------------------------------------------------------|-----|

## Section 9: Heat and mass transfer

|                                                                                                                                                              |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| A three-dimensional study of the heat and mass transfer within<br>the irradiation space of the HIFAR fuel element<br><i>G.H. Yeoh &amp; G.J. Storr</i> ..... | 343 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                    |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| A comparison between computational and experimental results<br>for a research combustor<br><i>R.M. Morris, J.A. Visser &amp; P.J. Venter</i> ..... | 353 |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                          |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Bouyancy effects of heat and mass transfer in developing laminar flow in a<br>horizontal pipe<br><i>J. Orfi, N. Galanis &amp; S. Ben Nasrallah</i> ..... | 363 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                     |     |
|-------------------------------------------------------------------------------------------------------------------------------------|-----|
| Viscous liquid film flows over a vertical corrugated surface.<br>Calculation of heat and mass transfer<br><i>Yu. Trifonov</i> ..... | 373 |
|-------------------------------------------------------------------------------------------------------------------------------------|-----|

## Section 10: Advances in computational heat transfer methods

|                                                                                                                                                                                                                |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| ESTIMA: A thermal simulation software for the optimal design of<br>printed circuit board in the automotive industry<br><i>J. Bigorra, F.J. Sánchez, I. Cuesta, J. Herrero, J. Giralt &amp; F.X. Grau</i> ..... | 385 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                      |     |
|----------------------------------------------------------------------------------------------------------------------|-----|
| HTADAPT: An h-adaptive finite element model for heat transfer<br><i>D.W. Pepper, T. Wilcox &amp; L. Gewali</i> ..... | 395 |
|----------------------------------------------------------------------------------------------------------------------|-----|

|------------------------------------------------------------------------------------------------------------------------------|-----|
| Modified thermal calculations of a geothermal double-pipe heat exchanger<br>with insulation immersed into geothermal deposit |     |
| <i>T. Kujawa &amp; W. Novak</i> .....                                                                                        | 467 |

|                                                                                         |     |
|-----------------------------------------------------------------------------------------|-----|
| Large eddy simulation of turbulent flow and heat transfer in<br>compact heat exchangers |     |
| <i>P. Tochon, J.F. Fourmigue, P. Mercier &amp; B. Thonon</i> .....                      | 477 |

|                                                                                                                        |     |
|------------------------------------------------------------------------------------------------------------------------|-----|
| Modelling of compact evaporators and condensers                                                                        |     |
| <i>J.M. Corberán, P. Fernández de Córdoba, S. Ortuño, V. Ferri,<br/>J. González, T. Setaro &amp; G. Boccardi</i> ..... | 487 |

|                                                                                     |     |
|-------------------------------------------------------------------------------------|-----|
| Fluid to fluid heat exchanger: An improved design using a<br>twisted flat oval tube |     |
| <i>B. Vestergaard, R.L. Jørgensen &amp; O. Kusch</i> .....                          | 497 |

|                                                                      |     |
|----------------------------------------------------------------------|-----|
| Numerical investigation of plate heat exchanger surfaces             |     |
| <i>G. Bigoin, P. Tochon, J.F. Fourmigue &amp; J.M. Grillot</i> ..... | 507 |

## Section 12: Heat transfer in manufacturing and industry

|                                                                                    |     |
|------------------------------------------------------------------------------------|-----|
| A finite volume method model for prediction of the thermal camber<br>of work rolls |     |
| <i>J. Chen, R. Winkler &amp; G. Finstermann</i> .....                              | 519 |

|                                                                                                                                                        |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Calculation of losses in electric power cables as the base for<br>cable temperature analysis<br><i>I. Sarajcev, M. Majstrovic &amp; I. Medic</i> ..... | 529 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

### **Section 13: Cooling of electrical and electronic equipment**

|                                                                                                                      |     |
|----------------------------------------------------------------------------------------------------------------------|-----|
| Domain optimization in FEM modelling of power cable heat transfer<br><i>N. Kovac, B. Jajac &amp; D. Poljak</i> ..... | 541 |
|----------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                               |     |
|---------------------------------------------------------------------------------------------------------------|-----|
| Minimisation of heat sink mass using mathematical optimisation<br><i>D.J. de Kock &amp; J.A. Visser</i> ..... | 553 |
|---------------------------------------------------------------------------------------------------------------|-----|

|                                                                         |     |
|-------------------------------------------------------------------------|-----|
| A computational method to design heat sinks<br><i>J.A. Visser</i> ..... | 563 |
|-------------------------------------------------------------------------|-----|

### **Section 14: Coupling different numerical methods**

|                                                                                                        |     |
|--------------------------------------------------------------------------------------------------------|-----|
| Heat transfer in flat-plate solar air-heating collectors<br><i>Y. Nassar &amp; E. Sergievsky</i> ..... | 575 |
|--------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                |     |
|------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Analysis of temperature fluctuations in a turbulent flow over a<br>backward-facing step<br><i>O. Labbé, E. Montreuil &amp; P. Sagaut</i> ..... | 585 |
|------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                      |     |
|------------------------------------------------------------------------------------------------------|-----|
| Computational methods in food processing: Applications in heat transfer<br><i>S. Yanniotis</i> ..... | 595 |
|------------------------------------------------------------------------------------------------------|-----|

### **Section 15: Modelling and experiments in heat transfer**

|                                                                                                                                                            |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| The influence of self-generated magnetic fields on electric conduction in<br>inertially confined plasma<br><i>S. García, F. Fuentes &amp; C. Paz</i> ..... | 607 |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                   |     |
|---------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Influence of material thermal properties on instantaneous heat flux<br>measurements using an eroding thermocouple<br><i>S. Jedrzejowski</i> ..... | 617 |
|---------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                                                    |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Attainment of more precise parameters of a mathematical model for cooling flat<br>and cylindrical hot surfaces by nozzles<br><i>M. Pohanka, M. Raudenský &amp; J. Horský</i> ..... | 627 |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

|                                                                                                                                                          |     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Heat transfer of tubes in cross foam flow<br><i>J. Gylys, M. Jakubcionis &amp; S. Sinkunas</i> .....                                                     | 637 |
| Ceiling water panel heating-cooling systems. Experimental and simulated<br>study of the performances<br><i>J. Mirel, L. Serres &amp; S. Prétot</i> ..... | 647 |
| Numerical modeling for ablation of absorbing dielectrics<br><i>S. George &amp; K. Mitra</i> .....                                                        | 657 |
| <b>Index of Authors</b> .....                                                                                                                            | 667 |
