Preface	v
Foreword by Professor M. L. McGlashan	vii
SI units	xiii
Thermodynamic sign convention	xvi
1 Physical constants and conversion factors	1
2 Fundamental particles	1
3 The electromagnetic spectrum; the visible spectrum	2
 The elements	
4 The periodic classification (with atomic numbers)	3
5 Electronic configurations of the elements (ground states)	4
6 Energy levels for a many-electron atom	7
7 Properties of the elements: symbol, atomic number, relative atomic mass, density, melting temperature, boiling temperature, specific heat capacity, oxidation states	8
8 Crystal structures of the solid elements	12
9 Stable isotopes of the elements	13
10 Half-lives of radioactive elements	16
11 Radioactive series	17
12 Electric conductivities of the elements at 298 K	18
 Basic atomic and molecular properties	
13 Ionization energies of the elements: first ionization energies; successive ionization energies	19
14 Electron affinities of the elements	22
15 Atomic spectrum of hydrogen	23
16 Electronegativities of the elements (Pauling)	24
17 Percentage ionic character of a single bond	25
18 Dipole moments of inorganic compounds in the vapour phase	26
19 Metallic, covalent and van der Waals radii	27
20 Ionic radii	28
21 The shapes of molecules and ions	30
22 Spatial distribution of hybrid orbitals	31

23 Covalent bond lengths	31
24 Average bond enthalpies at 298 K	32
Thermodynamic properties	
25 Thermodynamic data for inorganic compounds, organic compounds: enthalpy of formation, Gibbs free energy of formation, entropy, heat capacity	33
26 Thermodynamic data relating to change of state for elements, compounds: enthalpy of fusion, enthalpy of vaporization, enthalpy of atomization	50
27 Thermodynamics of metal extraction	53
28 Enthalpies of combustion	54
29 Enthalpies of hydrogenation of gases	55
30 Enthalpies of solution at 298 K	56
31 Enthalpies of neutralization at 298 K	57
32 Enthalpies of formation of aqueous ions	58
33 Hydration enthalpies of ions	59
34 Lattice enthalpies at 298 K: alkali metal halides; other substances	59
35 Solubility of gases in water	60
36 Solubility of inorganic compounds	62
37 Azeotropes: binary mixtures at atmospheric pressure	64
38 Cryoscopic and ebullioscopic constants	65
39 Coagulation of hydrophobic colloids by electrolytes	66
40 Vapour pressure of water at various temperatures	67
41 Eutectic mixtures	68
42 Transition temperatures	68
43 Typical equilibrium data	69
44 Standard electrode potentials	70
45 Standard reference electrodes	73
46 Dissociation constants of inorganic acids	73
47 Ionic product of water at various temperatures	75
48 Solubility products	76
49 Stability (or formation) constants of complex ions at 298 K	77
50 Electrolytic conductivity of potassium chloride solution	79
51 Molar conductivity of aqueous solutions at 298 K	79
52 Molar conductivity of ions at infinite dilution at 298 K	80

Kinetic data

53 Kinetic data	81
54 Experimental rate laws	84
55 Activation energies	85

Organic data

56 Physical properties of organic compounds: melting temperature, boiling temperature, density, refractive index, solubility	86
57 Melting temperatures of organic derivatives	93
58 Strengths of organic acids	95
59 Dipole moments of organic compounds	98
60 Molar refractions	100

Analytical data

61 Standard solutions for titrimetric analysis	101
62 Acid-base indicators	102
63 Standard buffer solutions	102
64 Laboratory reagents	103

Miscellaneous data

65 Composition of the atmosphere	103
66 Composition of the earth's crust	104
67 Critical constants of gases	105

Logarithms and Anti-logarithms	106
--------------------------------	-----
